## Acid - Base

(a) What is the pH of a 2.0 molar solution of acetic acid. $\mathrm{K}_{\mathrm{a}}$ acetic acid $=1.8 \times 10^{-5}$
(b) A buffer solution is prepared by adding 0.10 liter of 2.0 molar acetic acid solution to 0.1 liter of a 1.0 molar sodium hydroxide solution. Compute the hydrogen ion concentration of the buffer solution.
(c) Suppose that 0.10 liter of 0.50 molar hydrochloric acid is added to 0.040 liter of the buffer prepared in (b). Compute the hydrogen ion concentration of the resulting solution.
Answer:
(a) $\mathrm{CH}_{3} \mathrm{COOH}_{(a q)} \leftrightarrow \mathrm{H}^{+}(a q)+\mathrm{CH}_{3} \mathrm{COO}^{-}(a q)$

$$
\mathrm{K}_{\mathrm{a}}=1.8 \times 10^{-5}=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{CH}_{3} \mathrm{COO}^{-}\right]}{\left[\mathrm{CH}_{3} \mathrm{COOH}\right]}
$$

$\left[\mathrm{H}^{+}\right]=\left[\mathrm{CH}_{3} \mathrm{COO}^{-}\right]=\mathrm{X}$
$\left[\mathrm{CH}_{3} \mathrm{COOH}\right]=2.0-\mathrm{X}, \mathrm{X} \ll 2.0,(2.0-\mathrm{X})=2.0$
$1.8 \times 10^{-5}=\frac{\mathrm{X}^{2}}{2.0}$
$\mathrm{X}=6.0 \times 10^{-3}=\left[\mathrm{H}^{+}\right] ; \mathrm{pH}=-\log \left[\mathrm{H}^{+}\right]=2.22$
(b) $0.1 \mathrm{~L} \times 2.0 \mathrm{~mol} / \mathrm{L}=0.20 \mathrm{~mol} \mathrm{CH}_{3} \mathrm{COOH}$
$0.1 \mathrm{~L} \times 1.0 \mathrm{~mol} / \mathrm{L}=0.10 \mathrm{~mol} \mathrm{NaOH}$
the 0.10 mol of hydroxide neutralizes $0.10 \mathrm{~mol} \mathrm{CH}_{3} \mathrm{COOH}$ with 0.10 mol remaining with a concentration of $0.10 \mathrm{~mol} / 0.20 \mathrm{~L}=0.5 \mathrm{M}$. This also produces 0.10 mol of acetate ion in 0.20 L , therefore, $\left[\mathrm{CH}_{3} \mathrm{COO}^{-}\right]=$ 0.50 M .
$1.8 \times 10^{-5}=\frac{\left[\mathrm{H}^{+}\right][0.50]}{[0.50]}$
$\left[\mathrm{H}^{+}\right]=1.8 \times 10^{-5}=\mathrm{pH}$ of 4.74
(c) $\left[\mathrm{CH}_{3} \mathrm{COOH}\right]_{0}=\left[\mathrm{CH}_{3} \mathrm{COO}^{-}\right]_{0}$
$=0.50 \mathrm{M} \times \frac{0.040 \mathrm{~L}}{0.14 \mathrm{~L}}=0.143 \mathrm{M}$
$\left[\mathrm{H}^{+}\right]_{0}=0.50 \mathrm{M} \times \frac{\mathrm{U} .10 \mathrm{~L}}{0.14 \mathrm{~L}}=0.357 \mathrm{M}$
the equilibrium will be pushed nearly totally to the left resulting in a decrease of the hydrogen ion by 0.143 M . Therefore, the $\left[\mathrm{H}^{+}\right]_{\mathrm{eq}}=0.357 \mathrm{M}-0.143 \mathrm{M}=0.214 \mathrm{M}$.

1970
$\mathrm{H}_{3} \mathrm{PO}_{2}, \mathrm{H}_{3} \mathrm{PO}_{3}$, and $\mathrm{H}_{3} \mathrm{PO}_{4}$ are monoprotic, diprotic and triprotic acids, respectively, and they are about equal strong acids.
$\mathrm{HClO}_{2}, \mathrm{HClO}_{3}$, and $\mathrm{HClO}_{4}$ are all monoprotic acids, but $\mathrm{HClO}_{2}$ is a weaker acid than $\mathrm{HClO}_{3}$ which is weaker than $\mathrm{HClO}_{4}$. Account for:
(a) The fact that the molecules of the three phosphorus acids can provide different numbers of protons.
(b) The fact that the three chlorine acids differ in strengths.

Answer:
(a) the structure for the three acids are as follows:

The hydrogen atom $(s)$ bonded directly to the phosphorus atom is/are not acidic in aqueous solution; only those hydrogen atoms bonded to the oxygen atoms can be released as protons.
(b) The acid strength is successively greater as the number of oxygen atoms increases because the very electronegative oxygen atoms are able to draw electrons away from the chlorine atom and the $\mathrm{O}-\mathrm{H}$ bond. This effect is more important as the number of attached oxygen atoms increases. This means that a proton is most readily produced by the molecule with the largest number of attached oxygen atoms.

1970
A comparison of the theories Arrhenius, Bronsted and Lewis shows a progressive generalization of the acid base concept. Outline the essential ideas in each of these theories and select three reactions, one that can be interpreted by all three theories, one that can be interpreted by two of them, and one that can be interpreted by only one of the theories. Provide these six interpretations.
Answer:
Arrhenius
acid $=$ produce $\mathrm{H}^{+}$ions in aqueous solution
base $=$ produce $\mathrm{OH}^{-}$ions in aqueous solution
Bronsted-Lowry
acid $=$ proton $\left(\mathrm{H}^{+}\right)$donor; base $=$proton acceptor
Lewis
acid $=\mathrm{e}-$ pair acceptor; base $=\mathrm{e}-$ pair donor

## Examples:

Interpreted by all three

$$
\begin{aligned}
& \mathrm{HCl}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}^{+}(a q)+\mathrm{Cl}^{-}(a q) \\
& \mathrm{NaOH}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{Na}^{+}(a q)+\mathrm{OH}^{-}(a q)
\end{aligned}
$$

Interpreted by two

$$
\mathrm{NH}_{3}+\mathrm{HCl} \leftrightarrow \mathrm{NH}_{4}^{+}+\mathrm{Cl}^{-}
$$

Interpreted by only one

$$
\mathrm{BF}_{3}+\mathrm{NH}_{3} \rightarrow \mathrm{~F}_{3} \mathrm{~B}: \mathrm{NH}_{3}
$$

1972 (repeated in gases topic)
A 5.00 gram sample of a dry mixture of potassium hydroxide, potassium carbonate, and potassium chloride is reacted with 0.100 liter of 2.00 molar HCl solution
(a) A 249 milliliter sample of dry $\mathrm{CO}_{2}$ gas, measured at $22^{\circ} \mathrm{C}$ and 740 torr, is obtained from this reaction. What is the percentage of potassium carbonate in the mixture?
(b) The excess HCl is found by titration to be chemically equivalent to 86.6 milliliters of 1.50 molar NaOH . Calculate the percentages of potassium hydroxide and of potassium chloride in the original mixture.
Answer:
(a) $\mathrm{K}_{2} \mathrm{CO}_{3}+2 \mathrm{HCl} \rightarrow \mathrm{CO}_{2}+2 \mathrm{KCl}+\mathrm{H}_{2} \mathrm{O}$
$\mathrm{mol} \mathrm{CO}_{2}=\frac{\mathrm{PV}}{\mathrm{RT}}=\frac{(140 \text { torr })(249 \mathrm{~mL})}{\left(62400 \frac{\mathrm{~mL} \text { _tar }}{\text { mol_K }}\right)(295 \mathrm{~K})}=0.0100 \mathrm{~mol} \mathrm{CO}_{2}$
$0.10 \mathrm{~mol} \mathrm{CO}_{2} \times 1 \mathrm{~mol} \mathrm{~K}_{2} \mathrm{CO}_{3} / 1 \mathrm{~mol} \mathrm{CO}_{2} \times 138.2 \mathrm{~g} \mathrm{~K}_{2} \mathrm{CO}_{3} / 1 \mathrm{~mol} \mathrm{~K}_{2} \mathrm{CO}_{3}=1.38 \mathrm{~g} \mathrm{~K}_{2} \mathrm{CO}_{3}$
$1.38 \mathrm{~g} \mathrm{~K}_{2} \mathrm{CO}_{3} / 5.00 \mathrm{~g}$ mixture $\times 100 \%=27.6 \% \mathrm{~K}_{2} \mathrm{CO}_{3}$
(b) orig. $\mathrm{mol} \mathrm{HCl}=0.100 \mathrm{~L} \times 2.00 \mathrm{M}=0.200 \mathrm{~mol}$
reacted with $\mathrm{K}_{2} \mathrm{CO}_{3} \quad=0.020 \mathrm{~mol}$
excess $\mathrm{HCl}=0.0866 \mathrm{~L} \times 1.50 \mathrm{M} \quad=\underline{0.130 \mathrm{~mol}}$
mol HCl that reacted w/KOH $\quad=0.050 \mathrm{~mol}$
$0.050 \mathrm{~mol} \mathrm{KOH}=2.81 \mathrm{~g}=56.1 \%$ of sample
the remaining KCl amounts to $16.3 \%$
1972
Given a solution of ammonium chloride. What additional reagent or reagents are needed to prepare a buffer from the ammonium chloride solution?
Explain how this buffer solution resists a change in pH when:
(a) Moderate amounts of strong acid are added.
(b) Moderate amounts of strong base are added.
(c) A portion of the buffer solution is diluted with an equal volume of water.

Answer:
Since ammonium chloride is a salt of a weak base, the weak base is needed, ammonia, $\mathrm{NH}_{3}$.
(a) When moderate amounts of a strong acid, $\mathrm{H}^{+}$, are added, the ammonia reacts with it. The concentration of the hydrogen ion remains essentially the same and therefore only a very small change in pH .

$$
\mathrm{NH}_{3}+\mathrm{H}^{+} \leftrightarrow \mathrm{NH}_{4}^{+}
$$

(b) When moderate amounts of a strong base, $\mathrm{OH}^{-}$, are added, the ammonium ion reacts with it. The concentration of the hydrogen ion remains essentially the same and therefore only a very small change in pH .

$$
\mathrm{NH}_{4}^{+}+\mathrm{OH}^{-} \leftrightarrow \mathrm{NH}_{3}+\mathrm{H}_{2} \mathrm{O}
$$

(c) By diluting with water the relative concentration ratio of $\left[\mathrm{NH}_{4}^{+}\right] /\left[\mathrm{NH}_{3}\right]$ does not change, therefore there should be no change in pH .

1973
A sample of 40.0 milliliters of a 0.100 molar $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$ solution is titrated with a 0.150 molar NaOH solution. $\mathrm{K}_{\mathrm{a}}$ for acetic acid $=1.8 \times 10^{-5}$
(a) What volume of NaOH is used in the titration in order to reach the equivalence point?
(b) What is the molar concentration of $\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}^{-}$at the equivalence point?
(c) What is the pH of the solution at the equivalence point?

Answer:
(a) $\mathrm{M}_{\mathrm{a}} \mathrm{V}_{\mathrm{a}}=\mathrm{M}_{\mathrm{b}} \mathrm{V}_{\mathrm{b}}$
$(0.100 \mathrm{M})(40.0 \mathrm{~mL})=(0.150 \mathrm{M})\left(\mathrm{V}_{\mathrm{b}}\right)$
$\mathrm{V}_{\mathrm{b}}=26.7 \mathrm{~mL}$
(b) acetate ion is a weak base with
$\mathrm{K}_{\mathrm{b}}=\mathrm{K}_{\mathrm{w}} / \mathrm{K}_{\mathrm{a}}=1.0 \times 10^{-14} / 1.8 \times 10^{-5}=5.6 \times 10^{-10}$
$\left[\mathrm{CH}_{3} \mathrm{COO}^{-}\right]_{\mathrm{O}}=\frac{4.00 \mathrm{mmol}}{(40.0 \mathrm{~mL}+26.7 \mathrm{~mL})}=0.0600 \mathrm{M}$
$\left[\mathrm{CH}_{3} \mathrm{COO}^{-}\right]_{\text {eq }}=0.600 \mathrm{M}-\mathrm{X}$
$\left[\mathrm{OH}^{-}\right]=\left[\mathrm{CH}_{3} \mathrm{COOH}\right]=\mathrm{X}$
$5.6 \times 10^{-10}=\frac{\mathrm{X}^{2}}{(0.0600-\mathrm{X})} ; \mathrm{X}=9.66 \times 10^{-5} \mathrm{M}$
$0.0600 \mathrm{M}-9.66 \times 10^{-5} \mathrm{M}=0.0599 \mathrm{M}\left[\mathrm{CH}_{3} \mathrm{COO}^{-}\right]_{\mathrm{cq}}$
(c)

$$
\begin{aligned}
& {\left[\mathrm{H}^{+}\right]=\frac{\mathrm{K}_{\mathrm{W}}}{\left[\mathrm{OH}^{-}\right]}=\frac{1.0 \times 10^{-14}}{9.66 \times 10^{-5}}=1.04 \times 10^{-10} \mathrm{M}} \\
& \mathrm{pH}=-\log \left[\mathrm{H}^{+}\right]=-\log \left(1.04 \times 10^{-10}\right)=9.98
\end{aligned}
$$

1974 A
A solution is prepared from 0.0250 mole of $\mathrm{HCl}, 0.10$ mole propionic acid, $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COOH}$, and enough water to make 0.365 liter of solution. Determine the concentrations of $\mathrm{H}_{3} \mathrm{O}^{+}, \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COOH}, \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COO}^{-}$, and $\mathrm{OH}^{-}$in this solution. $\mathrm{K}_{\mathrm{a}}$ for propionic acid $=1.3 \times 10^{-5}$
Answer:
$\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COOH}+\mathrm{H}_{2} \mathrm{O} \leftrightarrow \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COO}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}$
[ $\left.\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COO}^{-}\right]=\mathrm{X}$
$\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COOH}\right]=(0.10 \mathrm{~mol} / 0.365 \mathrm{~L})-\mathrm{X}$
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=(0.0250 \mathrm{~mol} / 0.365 \mathrm{~L})+\mathrm{X}$
$\mathrm{K}_{\mathrm{a}}=\frac{(\mathrm{X})(0.0685+\mathrm{X})}{0.274-\mathrm{X}}=1.3 \times 10^{-5} ; \mathrm{X}=5.2 \times 10^{-5}$
$\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COO}^{-}\right]=5.2 \times 10^{-5} \mathrm{M} ;\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COOH}\right]=0.274 \mathrm{M}$
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=0.0685 \mathrm{M}$;
$\left[\mathrm{OH}^{-}\right]=\frac{\mathrm{K}_{\mathrm{W}}}{0.0685}=1.46 \times 10^{-13} \mathrm{M}$

1975 A
(a) A 4.00 gram sample of $\mathrm{NaOH}_{(s)}$ is dissolved in enough water to make 0.50 liter of solution. Calculate the pH of the solution.
(b) Suppose that 4.00 grams of $\mathrm{NaOH}(s)$ is dissolved in 1.00 liter of a solution that is 0.50 molar in $\mathrm{NH}_{3}$ and 0.50 molar in $\mathrm{NH}_{4}{ }^{+}$. Assuming that there is no change in volume and no loss of $\mathrm{NH}_{3}$ to the atmosphere, calculate the concentration of hydroxide ion, after a chemical reaction has occurred. [Ionization constant at $25^{\circ} \mathrm{C}$ for the reaction $\left.\mathrm{NH}_{3}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{NH}_{4}^{+}+\mathrm{OH}^{-} ; \mathrm{K}=1.8 \times 10^{-5}\right]$
Answer:
(a) $\frac{4.00 \mathrm{gNaOH}}{0.50 \mathrm{~L}} \times \frac{1 \mathrm{~mol}}{40.0 \mathrm{~g}}=0.20 \mathrm{M}$

$$
\left[\mathrm{H}^{+}\right]=\frac{\mathrm{K}_{\mathrm{w}}}{0.20}=5 \times 10^{-14} ; \mathrm{pH}=-\log \left[\mathrm{H}^{+}\right]=13.3
$$

(b) $\left[\mathrm{OH}^{-}\right]=\frac{0.100 \mathrm{~mol}}{1.00 \mathrm{~L}}-\mathrm{X}$
$\left[\mathrm{NH}_{4}^{+}\right]=0.50 \mathrm{M}-\mathrm{X} ;\left[\mathrm{NH}_{3}\right]=0.50 \mathrm{M}+\mathrm{X}$
$1.8 \times 10^{-5}=\frac{(0.50-\mathrm{X})(0.100-\mathrm{X})}{(0.50+\mathrm{X})} ; \mathrm{X}=0.100 \mathrm{M}$
using the Henderson-Hasselbalch equation

## Acid - Base

1975
Reactions requiring either an extremely strong acid or an extremely strong base are carried out in solvents other than water. Explain why this is necessary for both cases.
Answer:
Water is amphoteric and can behave either as an acid in the presence of a strong base or as a base in the presence of strong acid.
Water also undergoes autoionization.
1976
$\begin{array}{lr}\mathrm{H}_{2} \mathrm{~S}+\mathrm{H}_{2} \mathrm{O} \leftrightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{HS}^{-} & \mathrm{K}_{1}=1.0 \times 10^{-7} \\ \mathrm{HS}^{-}+\mathrm{H}_{2} \mathrm{O} \leftrightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{S}^{2-} & \mathrm{K}_{2}=1.3 \times 10^{-13} \\ \mathrm{H}_{2} \mathrm{~S}+2 \mathrm{H}_{2} \mathrm{O} \leftrightarrow 2 \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{S}^{2-} & \mathrm{K}=1.3 \times 10^{-20} \\ \mathrm{Ag}_{2} \mathrm{~S}(s) \leftrightarrow 2 \mathrm{Ag}^{+}+\mathrm{S}^{2-} & \mathrm{K}_{\mathrm{sp}}=5.5 \times 10^{-51}\end{array}$
(a) Calculate the concentration of $\mathrm{H}_{3} \mathrm{O}^{+}$of a solution which is 0.10 molar in $\mathrm{H}_{2} \mathrm{~S}$.
(b) Calculate the concentration of the sulfide ion, $\mathrm{S}^{2-}$, in a solution that is 0.10 molar in $\mathrm{H}_{2} \mathrm{~S}$ and 0.40 molar in $\mathrm{H}_{3} \mathrm{O}^{+}$.
(c) Calculate the maximum concentration of silver ion, $\mathrm{Ag}^{+}$, that can exist in a solution that is $1.5 \times 10^{-17}$ molar in sulfide ion, $\mathrm{S}^{2-}$.
Answer:
(a) $\mathrm{H}_{2} \mathrm{~S}+\mathrm{H}_{2} \mathrm{O} \leftrightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{HS}^{-}$

$$
\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{HS}^{-}\right]}{\left[\mathrm{H}_{2} \mathrm{~S}\right]}=1.0 \times 10^{-7}
$$

let $\mathrm{X}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\left[\mathrm{HS}^{-}\right]$
$\frac{\mathrm{X}^{2}}{0.10-\mathrm{X}}=1.0 \times 10^{-7}$
X ïi 0.10; X $=1.0 \times 10^{-4} \mathrm{M}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$
(b) $\mathrm{H}_{2} \mathrm{~S}+2 \mathrm{H}_{2} \mathrm{O} \leftrightarrow 2 \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{S}^{2-}$

$$
\begin{aligned}
& \frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{S}^{2-}\right]}{\left[\mathrm{H}_{2} \mathrm{~S}\right]}=1.3 \times 10^{-20} \\
& \frac{[0.40]^{2}\left[\mathrm{~S}^{2-}\right]}{[0.10]}=1.3 \times 10^{-20} ;\left[\mathrm{S}^{2-}\right]=8.1 \times 10^{-21} \mathrm{M}
\end{aligned}
$$

(c) $\mathrm{Ag}_{2} \mathrm{~S}_{(s)} \leftrightarrow 2 \mathrm{Ag}^{+}+\mathrm{S}^{2-} ;\left[\mathrm{Ag}^{+}\right]^{2}\left[\mathrm{~S}^{2-}\right]=5.5 \times 10^{-51}$
$\left[\mathrm{Ag}^{+}\right]=\sqrt{\frac{5.5 \times 10^{-51}}{1.5 \times 10^{-17}}}=1.9 \times 10^{-17} \mathrm{M}$
1977
The value of the ionization constant, $\mathrm{K}_{\mathrm{a}}$, for hypochlorous acid, HOCl , is $3.1 \times 10^{-8}$.
(a) Calculate the hydronium ion concentration of a 0.050 molar solution of HOCl .
(b) Calculate the concentration of hydronium ion in a solution prepared by mixing equal volumes of 0.050 molar HOCl and 0.020 molar sodium hypochlorite, NaOCl .
(c) A solution is prepared by the disproportionation reaction below. $\mathrm{Cl}_{2}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{HCl}+\mathrm{HOCl}$

Calculate the pH of the solution if enough chlorine is added to water to make the concentration of HOCl equal to 0.0040 molar.
Answer:
(a) $\mathrm{HOCl}+\mathrm{H}_{2} \mathrm{O} \leftrightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{OCl}^{-}$
$3.2 \infty 10^{-8}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OCl}^{-}\right]}{[\mathrm{HOCl}]}=\frac{\mathrm{X}^{2}}{(0.050-\mathrm{X})}$
$\mathrm{X}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=4.0 \times 10^{-5} \mathrm{M}$
(b) $\mathrm{HOCl}+\mathrm{H}_{2} \mathrm{O} \leftrightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{OCl}^{-}$
$\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right][0.010+\mathrm{X}]}{[0.0250-\mathrm{X}]}=3.2 \propto 10^{-8}$

$$
; \quad \mathrm{X} \ll 0.010
$$

$\mathrm{X}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=8.0 \times 10^{-8} \mathrm{M}$
(c) $\mathrm{Cl}_{2}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{HCl}+\mathrm{HOCl}$
$[\mathrm{HOCl}]=[\mathrm{HCl}]=0.0040 \mathrm{M}$
HCl as principal source of $\mathrm{H}_{3} \mathrm{O}^{+}$
$\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=2.40$
1978 A
A 0.682 gram sample of an unknown weak monoprotic organic acid, HA was dissolved in sufficient water to make 50 milliliters of solution and was titrated with a 0.135 molar NaOH solution. After the addition of 10.6 milliliters of base, a pH of 5.65 was recorded. The equivalence point (end point) was reached after the addition of 27.4 milliliters of the 0.135 molar NaOH .
(a) Calculate the number of moles of acid in the original sample.
(b) Calculate the molecular weight of the acid HA.
(c) Calculate the number of moles of unreacted HA remaining in solution when the pH was 5.65.
(d) Calculate the $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$at $\mathrm{pH}=5.65$
(e) Calculate the value of the ionization constant, $\mathrm{K}_{\mathrm{a}}$, of the acid HA.

Answer:
(a) at equivalence point, moles $\mathrm{HA}=$ moles NaOH
$=\mathrm{M}_{\mathrm{b}} \mathrm{V}_{\mathrm{b}}=(0.0274 \mathrm{~L})(0.135 \mathrm{M})=3.70 \times 10^{-3} \mathrm{~mol} \mathrm{HA}$
molec.wt. $=\frac{\text { mass HA }}{\mathrm{mol} \mathrm{HA}}=\frac{0.68^{2} 2 \mathrm{~g}}{3.70 \propto 10^{-3} \mathrm{~mol}}=184 \mathrm{~g} / \mathrm{mol}$
(b)
(c) $\mathrm{HA}+\mathrm{OH}^{-} \rightarrow \mathrm{A}^{-}+\mathrm{H}_{2} \mathrm{O}$
initial: $\quad 0.00370 \mathrm{~mol}$
added: $\quad(0.0106 \mathrm{~L})(0.135 \mathrm{M})=0.00143$ mole
remaining: $(0.00370-0.00143)=0.00227 \mathrm{~mol}$
(d) $\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right] ;\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=10^{-\mathrm{pH}}=10^{-5.65}$
$=2.2 \times 10^{-6} \mathrm{M}$
(e) $\mathrm{K}_{\mathrm{a}}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{A}^{-}\right]}{[\mathrm{HA}]}=\frac{\left(2.2 \infty 10^{-6}\right)(0.00143 / \mathrm{v})}{(0.00227 / \mathrm{v})}$

$$
=1.4 \times 10^{-6}
$$

1978 D
Predict whether solutions of each of the following salts are acidic, basic, or neutral. Explain your prediction in each case
(a) $\mathrm{Al}\left(\mathrm{NO}_{3}\right)_{3}$
(b) $\mathrm{K}_{2} \mathrm{CO}_{3}$ (c) NaBr

Answer:
(a) acidic; $\mathrm{Al}^{3+}+\mathrm{H}_{2} \mathrm{O} \leftrightarrow \mathrm{AlOH}^{2+}+\mathrm{H}^{+}$;
hydrolysis of $\mathrm{Al}^{3+}$;
$\mathrm{Al}\left(\mathrm{OH}_{2}\right)_{\mathrm{n}}{ }^{3+}$ as Bronsted acid, etc.
(b) basic; $\mathrm{CO}_{3}{ }^{2-}+\mathrm{H}_{2} \mathrm{O} \leftrightarrow \mathrm{HCO}_{3}{ }^{-}+\mathrm{OH}^{-}$; or hydrolysis of $\mathrm{CO}_{3}{ }^{2-}$ as conjugate to a weak acid, etc.
(c) neutral; $\mathrm{Na}^{+}$from strong base; $\mathrm{Br}^{-}$from strong acid

1979 B
A solution of hydrochloric acid has a density of 1.15 grams per milliliter and is $30.0 \%$ by weight HCl .
(a) What is the molarity of this solution of HCl ?
(b) What volume of this solution should be taken in order to prepare 5.0 liters of 0.20 molar hydrochloric acid by dilution with water?
(c) In order to obtain a precise concentration, the 0.20 molar hydrochloric acid is standardized against pure HgO (molecular weight $=216.59$ ) by titrating the $\mathrm{OH}-$ produced according to the following quantitative reaction.

$$
\mathrm{HgO}(s)+4 \mathrm{I}^{-}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{HgI}_{4}{ }^{2-}+2 \mathrm{OH}^{-}
$$

In a typical experiment 0.7147 grams of HgO required 31.67 milliliters of the hydrochloric acid solution for titration. Based on these data what is the molarity of the HCl solution expressed to four significant figures.
Answer:
(a)

$$
\frac{1.1 \mathrm{gg}}{1 \mathrm{~mL}} \propto \frac{1000 \mathrm{~mL}}{1 \mathrm{~L}} \propto \frac{30.0 \mathrm{gHCl}}{100 \mathrm{~g}} \propto \frac{1 \mathrm{~mol}}{35.5 \mathrm{~g}}=9.5 \mathrm{M}
$$

(b) $\mathrm{M}_{\mathrm{f}} \mathrm{V}_{\mathrm{f}}=\mathrm{M}_{\mathrm{i}} \mathrm{V}_{\mathrm{i}}$
$(0.20 \mathrm{M})(5.0 \mathrm{~L})=(9.5 \mathrm{M})(\mathrm{V})$
$\mathrm{V}=0.11 \mathrm{~L}$
U. $/ 14 / \mathrm{g}$
$\frac{216.59 \mathrm{~g} / \mathrm{mol}}{}=0.003300 \mathrm{~mol} \mathrm{HgO}$
mol OH ${ }^{-}$prod. $=2(\mathrm{~mol} \mathrm{HgO})=0.006600 \mathrm{~mol}$
mol HCl req. $=$ mol OH ${ }^{-}$prod. $=0.006600 \mathrm{~mol}$
$\mathrm{M}_{\mathrm{HCl}}=\frac{\text { u. Uuobumol }}{0.03167 \mathrm{~L}}=0.2084 \mathrm{M}$

1979 D

$$
\begin{gathered}
\mathrm{NH}_{4}^{+}+\mathrm{OH}^{-} \leftrightarrow \mathrm{NH}_{3}+\mathrm{H}_{2} \mathrm{O} \\
\mathrm{H}_{2} \mathrm{O}+\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{O}^{-} \leftrightarrow \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}+\mathrm{OH}^{-}
\end{gathered}
$$

The equations for two acid-base reactions are given above. Each of these reactions proceeds essentially to completion to the right when carried out in aqueous solution.
(a) Give the Bronsted-Lowry definition of an acid and a base.
(b) List each acid and its conjugate base for each of the reactions above.
(c) Which is the stronger base, ammonia or the ethoxide ion. $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{O}^{-}$? Explain your answer.

Answer:
(a) acid $=$ proton donor; base $=$ proton acceptor
(b)

Acid Conjugate base

| $1{ }^{\text {st }}$ reaction | $\mathrm{NH}_{4}^{+}$ | $\mathrm{NH}_{3}$ |
| :---: | :---: | :---: |
| nd | $\mathrm{H}_{2} \mathrm{O}$ | $\mathrm{OH}^{-}$ |
|  | $\mathrm{H}_{2} \mathrm{O}$ | $\mathrm{OH}^{-}$ |
|  | $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$ | $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{O}^{-}$ |

(c) ethoxide is a stronger base than ammonia.

A stronger base is always capable of displacing a weaker base. Since both reactions are quantitative, in terms of base strength, $\mathrm{OH}^{-}>\mathrm{NH}_{3}$ in $1^{\text {st }}$ reaction; $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{O}^{-}>\mathrm{OH}^{-}$in $2^{\text {nd }}$ rxn.

1980 A
Methylamine $\mathrm{CH}_{3} \mathrm{NH}_{2}$, is a weak base that ionizes in solution as shown by the following equation.

$$
\mathrm{CH}_{3} \mathrm{NH}_{2}+\mathrm{H}_{2} \mathrm{O} \leftrightarrow \mathrm{CH}_{3} \mathrm{NH}_{3}^{+}+\mathrm{OH}^{-}
$$

(a) At $25^{\circ} \mathrm{C}$ the percentage ionization in a 0.160 molar solution of $\mathrm{CH}_{3} \mathrm{NH}_{2}$ is $4.7 \%$. Calculate [ $\mathrm{OH}^{-}$], $\left[\mathrm{CH}_{3} \mathrm{NH}_{3}{ }^{+}\right],\left[\mathrm{CH}_{3} \mathrm{NH}_{2}\right],\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$, and the pH of a 0.160 molar solution of $\mathrm{CH}_{3} \mathrm{NH}_{2}$ at $25^{\circ} \mathrm{C}$
(b) Calculate the value for $\mathrm{K}_{\mathrm{b}}$, the ionization constant for $\mathrm{CH}_{3} \mathrm{NH}_{2}$, at $25^{\circ} \mathrm{C}$.
(c) If 0.050 mole of crystalline lanthanum nitrate is added to 1.00 liter of a solution containing 0.20 mole of $\mathrm{CH}_{3} \mathrm{NH}_{2}$ and 0.20 mole of its salt $\mathrm{CH}_{3} \mathrm{NH}_{3} \mathrm{Cl}$ at $25^{\circ} \mathrm{C}$, and the solution is stirred until equilibrium is attained, will any $\mathrm{La}(\mathrm{OH})_{3}$ precipitate? Show the calculations that prove your answer. (The solubility constant for $\mathrm{La}(\mathrm{OH})_{3}, \mathrm{~K}_{\mathrm{sp}}=1 \times 10^{-19}$ at $25^{\circ} \mathrm{C}$ )
Answer:
(a) $\mathrm{CH}_{3} \mathrm{NH}_{2 ;} 0.160 \mathrm{M} \times 4.7 \%=7.5 \times 10^{-3} \mathrm{M}$ ionizing $(0.160 \mathrm{M}-0.0075 \mathrm{M})=0.0152 \mathrm{M} @$ equilibrium
$\left[\mathrm{CH}_{3} \mathrm{NH}_{3}^{+}\right]=\left[\mathrm{OH}^{-}\right]=7.5 \times 10^{-3} \mathrm{M}$
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\frac{\mathrm{K}_{\mathrm{w}}}{7.5 \infty 10^{-3}}=1.3 \propto 10^{-12} \mathrm{M}$

$$
\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=11.89
$$

(b)
$K_{b}=\frac{\left[\mathrm{CH}_{3} \mathrm{NH}_{3}^{+}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{CH}_{3} \mathrm{NH}_{2}\right]}=\frac{\left(7.5 \infty 10^{-3}\right)^{2}}{0.152}$
$=3.7 \times 10^{-4}$
(c) $\mathrm{K}_{\mathrm{b}}=3.7 \infty 10^{-4}=\frac{(\mathrm{U} .2 \mathrm{U}+\mathrm{X})(\mathrm{X})}{(.020-\mathrm{X})} \wedge \mathrm{X}$
$=\left[\mathrm{OH}^{-}\right]$
$Q=\left[\mathrm{La}^{3+}\right]\left[\mathrm{OH}^{-}\right]^{3}=(0.050)\left(3.7 \times 10^{-4}\right)^{3}$
$=2.5 \times 10^{-12}$
$Q>\mathrm{K}_{\mathrm{sp}}$, therefore, $\mathrm{La}(\mathrm{OH})_{3}$ precipitates

1981 D
$\mathrm{Al}\left(\mathrm{NO}_{3}\right)_{3} \quad \mathrm{~K}_{2} \mathrm{CO}_{3} \mathrm{NaHSO}_{4} \quad \mathrm{NH}_{4} \mathrm{Cl}$
(a) Predict whether a 0.10 molar solution of each of the salts above is acidic, neutral or basic.
(b) For each of the solutions that is not neutral, write a balanced chemical equation for a reaction occurring with water that supports your prediction.
Answer:
(a) $\mathrm{Al}\left(\mathrm{NO}_{3}\right)_{3}$ - acidic $\quad \mathrm{K}_{2} \mathrm{CO}_{3}$ - basic
$\mathrm{NaHSO}_{4}$ - acidic $\quad \mathrm{NH}_{4} \mathrm{Cl}$ - acidic
(b) $\mathrm{Al}^{3+}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{Al}(\mathrm{OH})^{2+}+\mathrm{H}^{+}$
$\mathrm{Al}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{3+}+\mathrm{H}_{2} \mathrm{O} \rightarrow\left[\mathrm{Al}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{OH}\right]^{2+}+\mathrm{H}_{3} \mathrm{O}^{+}$
$\mathrm{Al}^{3+}+3 \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{Al}(\mathrm{OH})_{3}+3 \mathrm{H}^{+}$
$\mathrm{CO}_{3}{ }^{2-}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{HCO}_{3}^{-}+\mathrm{OH}^{-}$
$\mathrm{HSO}_{4}^{-}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{SO}_{4}{ }^{2-}+\mathrm{H}_{3} \mathrm{O}^{+}$
$\mathrm{NH}_{4}{ }^{+}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{NH}_{3}+\mathrm{H}_{3} \mathrm{O}^{+}$
1982 A
A buffer solution contains 0.40 mole of formic acid, HCOOH , and 0.60 mole of sodium formate, HCOONa , in 1.00 litre of solution. The ionization constant, $\mathrm{K}_{\mathrm{a}}$, of formic acid is $1.8 \times 10^{-4}$.
(a) Calculate the pH of this solution.
(b) If 100. millilitres of this buffer solution is diluted to a volume of 1.00 litre with pure water, the pH does not change. Discuss why the pH remains constant on dilution.
(c) A 5.00 millilitre sample of 1.00 molar HCl is added to 100 . millilitres of the original buffer solution. Calculate the $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$of the resulting solution.
(d) A 800.-milliliter sample of $2.00-$ molar formic acid is mixed with 200 . milliliters of $4.80-$ molar NaOH . Calculate the $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$of the resulting solution.
Answer:
(a) using the Henderson-Hasselbalch equation
$p H=p K_{a}+\log \frac{\left.\stackrel{5}{5} \mathrm{~A}^{-}\right]-}{\leftrightarrows[\mathrm{HA}]} \downarrow$

$=3.92$ \{other approaches possible $\}$
(b) The pH remains unchanged because the ratio of the formate and formic acid concentration stays the same.
(c) initial concentrations
$1.00 \mathrm{M} \mathrm{HCl} \infty \frac{. .00 \mathrm{~mL}}{105 \mathrm{~mL}}=0.0476 \mathrm{M}$
$0.40 \mathrm{M} \mathrm{HCOOH} \propto \frac{1 \omega \mathrm{~mL}}{105 \mathrm{~mL}}=0.38 \mathrm{M}$
$0.60 \mathrm{M} \mathrm{HCOO}^{-} \infty \frac{1 \omega \mathrm{~mL}}{105 \mathrm{~mL}}=0.57 \mathrm{M}$
concentrations after $\mathrm{H}^{+}$reacts with $\mathrm{HCOO}^{-}$
$0.38 \mathrm{M}+0.05 \mathrm{M}=0.43 \mathrm{M} \mathrm{HCOOH}$
$0.57 \mathrm{M}-0.05 \mathrm{M}=0.52 \mathrm{M} \mathrm{HCOO}^{-}$
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=1.8 \infty 10^{-4} \infty \frac{\mathrm{U} .45 \mathrm{M} \mathrm{M}}{0.52 \mathrm{M}}=1.5 \infty^{-4} \mathrm{M}$
(d) $0.800 \mathrm{~L} \times 2.00 \mathrm{M} \mathrm{HCOOH}=1.60 \mathrm{~mol}$
$0.200 \mathrm{~L} \times 4.80 \mathrm{M} \mathrm{NaOH}=0.96 \mathrm{~mol} \mathrm{OH}^{-}$
at equil., $(1.60-0.96)=0.64 \mathrm{~mol} \mathrm{HCOOH}$ and $0.96 \mathrm{~mol} \mathrm{HCOO}^{-}$
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=1.8 \propto 10^{-4} \infty \frac{\mathrm{U.64VI}}{0.96 \mathrm{M}}=1.2 \infty^{-4} \mathrm{M}$

1982 D
A solution of barium hydroxide is titrated with $0.1-\mathrm{M}$ sulfuric acid and the electrical conductivity of the solution is measured as the titration proceeds. The data obtained are plotted on the graph below.

Millilitres of 0.1-M $\mathrm{H}_{2} \mathrm{SO}_{4}$
(a) For the reaction that occurs during the titration described above, write a balanced net ionic equation.
(b) Explain why the conductivity decreases, passes through a minimum, and then increases as the volume of $\mathrm{H}_{2} \mathrm{SO}_{4}$ added to the barium hydroxide is increased.
(c) Calculate the number of moles of barium hydroxide originally present in the solution that is titrated.
(d) Explain why the conductivity does not fall to zero at the equivalence point of this titration.

Answer:
(a) $\mathrm{Ba}^{2+}+2 \mathrm{OH}^{-}+2 \mathrm{H}^{+}+\mathrm{SO}_{4}^{2-} \rightarrow \mathrm{BaSO}_{4}(s)+2 \mathrm{H}_{2} \mathrm{O}$
(b) The initial conductivity is high because of the presence of $\mathrm{Ba}^{2+}$ and $\mathrm{OH}^{-}$ions. The conductivity decreases because $\mathrm{Ba}^{2+}$ forms insoluble $\mathrm{BaSO}_{4}$ with the addition of $\mathrm{SO}_{4}{ }^{2-}$. The conductivity also decreases because $\mathrm{OH}^{-}$combines with the addition of $\mathrm{H}^{+}$ions by forming $\mathrm{H}_{2} \mathrm{O}$.
Beyond the equivalence point conductivity increases as $\mathrm{H}^{+}$and $\mathrm{SO}_{4}{ }^{2-}$ ions are added.
(c) $\# \mathrm{~mol} \mathrm{Ba}(\mathrm{OH})_{2}=\# \mathrm{~mol} \mathrm{H}_{2} \mathrm{SO}_{4}$
$=0.1 \mathrm{M} \times 0.04 \mathrm{~L}=0.004 \mathrm{~mol}$
(d) $\mathrm{BaSO}_{4}(s)$ dissociates slightly to form $\mathrm{Ba}^{2+}$ and $\mathrm{SO}_{4}{ }^{2-}$, while the water ionizes slightly to form $\mathrm{H}^{+}$and $\mathrm{OH}^{-}$.

1983 B
The molecular weight of a monoprotic acid HX was to be determined. A sample of 15.126 grams of HX was dissolved in distilled water and the volume brought to exactly 250.00 millilitres in a volumetric flask. Several

## Acid - Base

50.00 millilitre portions of this solution were titrated against NaOH solution, requiring an average of 38.21 millilitres of NaOH .
The NaOH solution was standardized against oxalic acid dihydrate, $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4} 2 \mathrm{H}_{2} \mathrm{O}$ (molecular weight: 126.066 gram $\mathrm{mol}^{-1}$ ). The volume of NaOH solution required to neutralize 1.2596 grams of oxalic acid dihydrate was 41.24 millilitres.
(a) Calculate the molarity of the NaOH solution.
(b) Calculate the number of moles of HX in a 50.00 millilitre portion used for titration.
(c) Calculate the molecular weight of HX.
(d) Discuss the effect of the calculated molecular weight of HX if the sample of oxalic acid dihydrate contained a nonacidic impurity.
Answer:
(a) $\mathrm{mol} \mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4} 2 \mathrm{H}_{2} \mathrm{O}=\frac{1.2596 \mathrm{~g}}{126.066 \mathrm{~g} / \mathrm{mol}}=$
$9.9916 \times 10^{-3} \mathrm{~mol}$
$\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}+2 \mathrm{NaOH} \rightarrow \mathrm{Na}_{2} \mathrm{C}_{2} \mathrm{O}_{4}+2 \mathrm{H}_{2} \mathrm{O}$
$9.9916 \times 10^{-3} \mathrm{~mol} \times \frac{2 \mathrm{molNaUH}^{1 \mathrm{molH}_{2} \mathrm{C}_{2} \mathrm{O}_{4}}=1.9983 \times 10^{-2} \mathrm{~mol}_{\mathrm{M}}^{\mathrm{NaO}}}{}=\frac{1.9983 \times 10^{-2} \mathrm{~mol}}{0.04124 \mathrm{~L}}=0.4846 \mathrm{M}$
(b) $\mathrm{mol} \mathrm{HX}=\mathrm{mol} \mathrm{NaOH}$
$0.03821 \mathrm{~L} \times 0.4846 \mathrm{M}=0.01852 \mathrm{~mol} \mathrm{HX}$
(c) $\frac{U .01852 \mathrm{~mol}}{50.00 \mathrm{~mL}} \times 250.00 \mathrm{~mL}=0.09260 \mathrm{~mol} \mathrm{HX}$
$M W=\frac{15.126 \mathrm{~g}}{0.09260 \mathrm{~mol}}=163.3 \mathrm{~g} / \mathrm{mol}$
(d) The calculated molecular weight is smaller than true value, because:
measured $\mathrm{g} \mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}$ is larger than true value, calculated $\mathrm{mol} \mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}$ is larger than true value, calculated mol NaOH is larger than true value, calculated M NaOH is larger than true value calculated mol HX is larger than true value, therefore,
$\mathrm{MW}=\frac{\mathrm{g} \mathrm{HX} \text { (true value) }}{\mathrm{mol} \mathrm{HX}(\text { calculated, and too large) }}$

## 1983 C

(a) Specify the properties of a buffer solution. Describe the components and the composition of effective buffer solutions.
(b) An employer is interviewing four applicants for a job as a laboratory technician and asks each how to prepare a buffer solution with a pH close to 9 .
Archie A. says he would mix acetic acid and sodium acetate solutions.
Beula B. says she would mix $\mathrm{NH}_{4} \mathrm{Cl}$ and HCl solutions.
Carla C. says she would mix $\mathrm{NH}_{4} \mathrm{Cl}$ and $\mathrm{NH}_{3}$ solutions.
Dexter D. says he would mix $\mathrm{NH}_{3}$ and NaOH solutions.

## Acid - Base

Which of these applicants has given an appropriate procedure? Explain your answer, referring to your discussion in part (a). Explain what is wrong with the erroneous procedures.
(No calculations are necessary, but the following acidity constants may be helpful: acetic acid, $\mathrm{K}_{\mathrm{a}}=1.8 \times 10^{-}$ ${ }^{5}$; $\mathrm{NH}_{4}{ }^{+}, \mathrm{K}_{\mathrm{a}}=5.6 \times 10^{-10}$ )
Answer:
(a) A buffer solution resists changes in pH upon the addition of an acid or base.

Preparation of a buffer: (1) mix a weak acid + a salt of a weak acid; or (2) mix a weak base + salt of a weak base; or (3) mix a weak acid with about half as many moles of strong base; or (4) mix a weak base with about half as many moles of strong acid; or (5) mix a weak acid and a weak base.
(b) Carla has the correct procedure, she has mixed a weak base, $\mathrm{NH}_{3}$, with the salt of a weak base, $\mathrm{NH}_{4} \mathrm{Cl}$.

Archie has a buffer solution but a pH of around 5 .
Beula doesn't have a buffer solution, her solution consists of a strong acid and a salt of a weak base.
Dexter does not have a buffer solution, since his solution consists of a weak base plus a strong base.
1984 A
Sodium benzoate, $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COONa}$, is the salt of a the weak acid, benzoic acid, $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}$. A 0.10 molar solution of sodium benzoate has a pH of 8.60 at room temperature.
(a) Calculate the $\left[\mathrm{OH}^{-}\right]$in the sodium benzoate solution described above.
(b) Calculate the value for the equilibrium constant for the reaction:

$$
\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COO}^{-}+\mathrm{H}_{2} \mathrm{O} \leftrightarrow \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}+\mathrm{OH}^{-}
$$

(c) Calculate the value of $\mathrm{K}_{\mathrm{a}}$, the acid dissociation constant for benzoic acid.
(d) A saturated solution of benzoic acid is prepared by adding excess solid benzoic acid to pure water at room temperature. Since this saturated solution has a pH of 2.88 , calculate the molar solubility of benzoic acid at room temperature.
Answer:
(a) $\mathrm{pH}=8.6, \mathrm{pOH}=5.4$
$\left[\mathrm{OH}^{-}\right]=10^{-\mathrm{POH}}=3.98 \times 10^{-6} \mathrm{M}$
(b) $\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}\right]=\left[\mathrm{OH}^{-}\right]$
$\mathrm{K}_{\mathrm{b}}=\frac{\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COH}^{-}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO}_{2}^{-}\right]}=\frac{\left(3.98 \times 10^{-6}\right)^{2}}{\left(0.1-3.98 \times 10^{-6}\right)}$
$=1.58 \times 10^{-10}$
(c)
$\mathrm{K}_{\mathrm{a}}=\frac{\mathrm{K}_{\mathrm{W}}}{\mathrm{K}_{\mathrm{b}}}=\frac{1.0 \times 10^{-14}}{\left.1.58 \times 10^{-10}\right)}=6.33 \times 10^{-5}$
(d) $\mathrm{pH} 2.88=1.32 \times 10^{-3} \mathrm{M}\left[\mathrm{H}^{+}\right]=\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COO}^{-}\right]$

$$
\begin{aligned}
& {\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO}_{2} \mathrm{H}\right]=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO}_{2}^{-}\right]}{\mathrm{K}_{\mathrm{a}}}=\frac{\left(1.32 \times 10^{-3}\right)^{2}}{6.33 \times 10^{-5}}} \\
& =2.75 \times 10^{-2} \mathrm{M}\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}\right] \\
& \text { total dissolved }=\left(2.75 \times 10^{-2} \mathrm{M}+1.32 \times 10^{-3} \mathrm{M} \text { as ions }\right) \\
& =2.88 \times 10^{-2} \mathrm{M}
\end{aligned}
$$

Discuss the roles of indicators in the titration of acids and bases. Explain the basis of their operation and the factors to be considered in selecting an appropriate indicator for a particular titration.

## Answer:

An indicator signals the end point of a titration by changing color.
An indicator is a weak acid or weak base where the acid form and basic form of the indicators are of different colors.

An indicator changes color when the pH of the solution equals the pKa of the indicator. In selecting an indicator, the pH at which the indicator changes color should be equal to (or bracket) the pH of the solution at the equivalence point.

For example, when a strong acid is titrated with a strong base, the pH at the equivalence point is 7 , so we would choose an indicator that changes color at a $\mathrm{pH}=7$. \{Many other examples possible.\}

## 1986 A

In water, hydrazoic acid, $\mathrm{HN}_{3}$, is a weak acid that has an equilibrium constant, $\mathrm{K}_{\mathrm{a}}$, equal to $2.8 \times 10^{-5}$ at $25^{\circ} \mathrm{C}$. A 0.300 litre sample of a 0.050 molar solution of the acid is prepared.
(a) Write the expression for the equilibrium constant, $\mathrm{K}_{\mathrm{a}}$, for hydrazoic acid.
(b) Calculate the pH of this solution at $25^{\circ} \mathrm{C}$.
(c) To 0.150 litre of this solution, 0.80 gram of sodium azide, $\mathrm{NaN}_{3}$, is added. The salt dissolved completely. Calculate the pH of the resulting solution at $25^{\circ} \mathrm{C}$ if the volume of the solution remains unchanged.
(d) To the remaining 0.150 litre of the original solution, 0.075 litre of 0.100 molar NaOH solution is added. Calculate the $\left[\mathrm{OH}^{-}\right]$for the resulting solution at $25^{\circ} \mathrm{C}$.
Answer:
(a) $\mathrm{HN}_{3} \leftrightarrow \mathrm{H}^{+}+\mathrm{N}_{3}^{-}$
$\mathrm{K}_{\mathrm{a}}=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{N}_{3}^{-}\right]}{\left[\mathrm{HN}_{3}\right]}$
(b) $\left[\mathrm{H}^{+}\right]=\left[\mathrm{N}_{3}^{-}\right]=\mathrm{X}$
$2.8 \times 10^{-5}=\frac{\mathrm{X}^{2}}{0.050} ; \mathrm{X}=1.2 \times 10^{-3} \mathrm{M}$
$\mathrm{pH}=-\log \left[\mathrm{H}^{+}\right]=2.93$
(c) $\left[\mathrm{N}_{3}^{-}\right]=\frac{0.80 \mathrm{~g}}{0.150 \mathrm{~L}} \times \frac{1 \mathrm{~mol}}{65 \mathrm{~g}}=0.082 \mathrm{M}$
$2.8 \times 10^{-5}=\frac{\left[\mathrm{H}^{+}\right](0.082)}{0.050} ;\left[\mathrm{H}^{+}\right]=1.7 \times 10^{-5} \mathrm{M}$
$\mathrm{pH}=4.77$
(d) $(0.075 \mathrm{~L})(0.100 \mathrm{M})=0.0075 \mathrm{~mol} \mathrm{NaOH}$ $(0.150 \mathrm{~L})(0.050 \mathrm{M})=0.0075 \mathrm{~mol} \mathrm{HN}_{3}$
$\mathrm{OH}^{-}+\mathrm{HN}_{3} \rightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{N}_{3}^{-}$; neut. complete

$\mathrm{X}=\left[\mathrm{OH}^{-}\right]=3.5 \times 10^{-6} \mathrm{M}$

## 1986 D

$\mathrm{H}_{2} \mathrm{SO}_{3} \quad \mathrm{HSO}_{3}^{-} \quad \mathrm{HClO}_{4} \quad \mathrm{HClO}_{3} \quad \mathrm{H}_{3} \mathrm{BO}_{3}$
Oxyacids, such as those above, contain an atom bonded to one or more oxygen atoms; one or more of these oxygen atoms may also be bonded to hydrogen.
(a) Discuss the factors that are often used to predict correctly the strengths of the oxyacids listed above.
(b) Arrange the examples above in the order of increasing acid strength.

Answer:
(a) 1) As effective nuclear charge on central atom increases, acid strength increases. OR

As number of lone oxygen atoms (oxygen atoms not bonded to hydrogen) increases, acid strength increas-
es. OR
As electronegativity of central atom increases, acid strength increases.
2) Loss of $\mathrm{H}^{+}$by a neutral acid molecule reduces acid strength. OR
$\mathrm{K}_{\mathrm{a}}$ of $\mathrm{H}_{2} \mathrm{SO}_{3}>\mathrm{K}_{\mathrm{a}}$ of $\mathrm{HSO}_{3}^{-}$
(b) $\mathrm{H}_{3} \mathrm{BO}_{3}<\mathrm{HSO}_{3}^{-}<\mathrm{H}_{2} \mathrm{SO}_{3}<\mathrm{HClO}_{3}<\mathrm{HClO}_{4}$
$\mathrm{H}_{3} \mathrm{BO}_{3}$ or $\mathrm{HSO}_{3}{ }^{-}$weakest (must be together)
1987 A
$\mathrm{NH}_{3}+\mathrm{H}_{2} \mathrm{O} \leftrightarrow \mathrm{NH}_{4}^{+}+\mathrm{OH}^{-}$Ammonia is a weak base that dissociates in water as shown above. At $25^{\circ} \mathrm{C}$, the base dissociation constant, $\mathrm{K}_{\mathrm{b}}$, for $\mathrm{NH}_{3}$ is $1.8 \times 10^{-5}$.
(a) Determine the hydroxide ion concentration and the percentage dissociation of a 0.150 molar solution of ammonia at $25^{\circ} \mathrm{C}$.
(b) Determine the pH of a solution prepared by adding 0.0500 mole of solid ammonium chloride to 100 . millilitres of a 0.150 molar solution of ammonia.
(c) If 0.0800 mole of solid magnesium chloride, $\mathrm{MgCl}_{2}$, is dissolved in the solution prepared in part (b) and the resulting solution is well-stirred, will a precipitate of $\mathrm{Mg}(\mathrm{OH})_{2}$ form? Show calculations to support your answer. (Assume the volume of the solution is unchanged. The solubility product constant for $\operatorname{Mg}(\mathrm{OH})_{2}$ is $1.5 \times 10^{-11}$.
Answer:
(a) $\left[\mathrm{NH}_{4}^{+}\right]=\left[\mathrm{OH}^{-}\right]=\mathrm{X} ;\left[\mathrm{NH}_{3}\right]=(0.150-\mathrm{X})$ $\mathrm{K}_{\mathrm{b}}=\frac{\left[\mathrm{NH}_{4}^{+}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{NH}_{3}\right]} ; 1.8 \times 10^{-5}=\frac{\mathrm{X}^{2}}{0.150 \rightsquigarrow \mathrm{X}}$
$\mathrm{X}=\left[\mathrm{OH}^{-}\right]=1.6 \times 10^{-3} \mathrm{M}$
$\%$ diss. $=\frac{1.6 \times 10^{3}}{0.150} \times 100 \%=1.1 \%$
(b) $\left[\mathrm{NH}_{4}^{+}\right]=0.0500 \mathrm{~mol} / 0.100 \mathrm{~L}=0.500 \mathrm{M}$
$\left[\mathrm{NH}_{3}\right]=0.150 \mathrm{M}$
$1.8 \times 10^{-5}=\frac{(0.500)(\mathrm{X})}{0.150} ; \mathrm{X}=\left[\mathrm{OH}^{-}\right]=5.4 \times 10^{-6} \mathrm{M}$
$\mathrm{pOH}=5.27 ; \mathrm{pH}=(14-5.27)=8.73$
(c) $\mathrm{Mg}(\mathrm{OH})_{2} \leftrightarrow \mathrm{Mg}^{2+}+2 \mathrm{OH}^{-}$
$\left[\mathrm{Mg}^{2+}\right]=(0.0800 \mathrm{~mol} / 0.100 \mathrm{~L})=0.800 \mathrm{M}$
$\left[\mathrm{OH}^{-}\right]=5.4 \times 10^{-6} \mathrm{M}$
$Q=\left[\mathrm{Mg}^{2+}\right]\left[\mathrm{OH}^{-}\right]^{2}=(0.800)\left(5.4 \times 10^{-6}\right)^{2}$
$=2.3 \times 10^{-11}$
$Q>\mathrm{K}_{\text {sp }}$ so $\mathrm{Mg}(\mathrm{OH})_{2}$ precipitates

## 1987 B

The percentage by weight of nitric acid, $\mathrm{HNO}_{3}$, in a sample of concentrated nitric acid is to be determined.
(a) Initially a NaOH solution was standardized by titration with a sample of potassium hydrogen phthalate, $\mathrm{KHC}_{8} \mathrm{H}_{4} \mathrm{O}_{4}$, a monoprotic acid often used as a primary standard. A sample of pure $\mathrm{KHC}_{8} \mathrm{H}_{4} \mathrm{O}_{4}$ weighing 1.518 grams was dissolved in water and titrated with the NaOH solution. To reach the equivalence point, 26.90 millilitres of base was required. Calculate the molarity of the NaOH solution. (Molecular weight: $\mathrm{KHC}_{8} \mathrm{H}_{4} \mathrm{O}_{4}=204.2$ )
(b) A 10.00 millilitre sample of the concentrated nitric acid was diluted with water to a total volume of 500.00 millilitres. Then 25.00 millilitres of the diluted acid solution was titrated with the standardized NaOH solution prepared in part (a). The equivalence point was reached after 28.35 millilitres of the base had been added. Calculate the molarity of the concentrated nitric acid.
(c) The density of the concentrated nitric acid used in this experiment was determined to be 1.42 grams per millilitre. Determine the percentage by weight of $\mathrm{HNO}_{3}$ in the original sample of concentrated nitric acid.
Answer:
(a) $1.518 \mathrm{~g} \times \frac{1 \mathrm{~mol}}{204.2 \mathrm{~g}}=7.434 \times 10^{-3} \mathrm{~mol}$ acid $=\mathrm{mol} \mathrm{NaOH}$ required to neut.
$\frac{7.434 \times 10^{-3} \mathrm{~mol}}{0.02690 \mathrm{~L}}=0.2764 \mathrm{M} \mathrm{NaOH}$
(b) $\frac{28.35 \mathrm{mLNaOH}_{2}}{25.00 \mathrm{mLHNO}_{3}} \times \frac{0.2764 \mathrm{~mol}}{1 \mathrm{~L}} \times \frac{1 \mathrm{molHNO}_{3}}{1 \mathrm{molNaOH}}=0.3134 \mathrm{M} \mathrm{HNO}_{3}$
$\mathrm{M}_{\mathrm{f}} \mathrm{V}_{\mathrm{f}}=\mathrm{M}_{\mathrm{i}} \mathrm{V}_{\mathrm{i}} ;(0.3134 \mathrm{M})(500 \mathrm{~mL})=(\mathrm{M})(10.00 \mathrm{~mL})$
$\mathrm{M}=15.67 \mathrm{M} \mathrm{HNO}_{3}$
(c) $\% \mathrm{HNO}_{3}$ in conc. sol'n $=\frac{\mathrm{g} / \mathrm{LHNO}_{3}}{\mathrm{~g} / \mathrm{L} \text { sol'n }} \times 100 \%$
grams $\mathrm{HNO}_{3}$ in 1 L conc. Sol'n $=$
$\frac{15.67 \mathrm{molHNO}_{3}}{1 \mathrm{~L}} \times \frac{63.02 \mathrm{~g}}{1 \mathrm{~mol}}=987.5 \mathrm{~g} / \mathrm{L}$
grams sol'n in 1 L conc. sol'n
$\frac{1.42 \mathrm{~g} \mathrm{sol} ' \mathrm{n}}{1 \mathrm{~mL}} \times \frac{1000 \mathrm{~mL}}{1 \mathrm{~L}}=1420 \mathrm{~g} / \mathrm{L}$

$$
[\mathrm{HA}]=\frac{(0.01523 \mathrm{~L})(0.2211 \mathrm{mok})}{0.07000 \mathrm{~L}}=0.04810 \mathrm{M}
$$

$$
\mathrm{K}=\frac{\left[\mathrm{OH}^{-}\right][\mathrm{HA}]}{\left[\mathrm{A}^{-}\right]}=\frac{\mathrm{K}_{\mathrm{w}}}{\mathrm{~K}_{\mathrm{a}}}=\frac{1 . \times 10^{-14}}{7.7 \times 10^{-5}}=1.3 \times 10^{-10}
$$

$$
\left[\mathrm{A}^{-}\right]=\frac{7.789 \times 10^{-3} \mathrm{~mol}}{0.08523 \mathrm{~L}}=0.0914 \mathrm{M}
$$

1988 D

A 30.00 millilitre sample of a weak monoprotic acid was titrated with a standardized solution of NaOH . A pH meter was used to measure the pH after each increment of NaOH was added, and the curve above was constructed.
(a) Explain how this curve could be used to determine the molarity of the acid.
(b) Explain how this curve could be used to determine the dissociation constant $\mathrm{K}_{\mathrm{a}}$ of the weak monoprotic acid.
(c) If you were to repeat the titration using a indicator in the acid to signal the endpoint, which of the following indicators should you select? Give the reason for your choice.

| Methyl red | $\mathrm{K}_{\mathrm{a}}=1 \times 10^{-5}$ |
| :--- | :--- |
| Cresol red | $\mathrm{K}_{\mathrm{a}}=1 \times 10^{-8}$ |
| Alizarin yellow | $\mathrm{K}_{\mathrm{a}}=1 \times 10^{-11}$ |

(d) Sketch the titration curve that would result if the weak monoprotic acid were replaced by a strong monoprotic acid, such as HCl of the same molarity. Identify differences between this titration curve and the curve shown above.
Answer:
(a) The sharp vertical rise in pH on the pH -volume curve appears at the equivalence point (about 23 mL ). Because the acid is monoprotic, the number of moles of acid equals the number of moles of NaOH . That number is the product of the exact volume and the molarity of the NaOH . The molarity of the acid is the number of moles of the acid divided by 0.30 L , the volume of the acid.
(b) At the half-equivalence point (where the volume of the base added is exactly half its volume at the equivalence point), the concentration [HX] of the weak acid equals the concentration [ $\mathrm{X}^{-}$] of its anion. Thus, in the equilibrium expression $\left[\mathrm{H}^{+}\right]\left[\mathrm{X}^{-}\right] /[\mathrm{HX}]=\mathrm{K}_{\mathrm{a}},\left[\mathrm{H}^{+}\right]=\mathrm{K}_{\mathrm{a}}$. Therefore, pH at the half-equivalence point equals $\mathrm{pK}_{\mathrm{a}}$.
(c) Cresol red is the best indicator because its $\mathrm{pK}_{\mathrm{a}}$ (about 8) appears midway in the steep equivalence region. This insures that at the equivalence point the maximum color change for the minimal change in the volume of NaOH added is observed.
(d)

1989 A
In an experiment to determine the molecular weight and the ionization constant for ascorbic acid (vitamin C), a student dissolved 1.3717 grams of the acid in water to make 50.00 millilitres of solution. The entire solution was titrated with a 0.2211 molar NaOH solution. The pH was monitored throughout the titration. The equivalence point was reached when 35.23 millilitres of the base has been added. Under the conditions of this experiment, ascorbic acid acts as a monoprotic acid that can be represented as HA.
(a) From the information above, calculate the molecular weight of ascorbic acid.
(b) When 20.00 millilitres of NaOH had been added during the titration, the pH of the solution was 4.23 . Calculate the acid ionization constant for ascorbic acid.
(c) Calculate the equilibrium constant for the reaction of the ascorbate ion, $\mathrm{A}^{-}$, with water.
(d) Calculate the pH of the solution at the equivalence point of the titration.

Answer:
(a) $(0.2211 \mathrm{M})(0.03523 \mathrm{~L})=7.789 \times 10^{-3} \mathrm{~mol}$

$$
1.3717 \mathrm{~g} / 7.789 \times 10^{-3} \mathrm{~mol}=176.1 \mathrm{~g} / \mathrm{mol}
$$

(b) at $\mathrm{pH} 4.23,\left[\mathrm{H}^{+}\right]=8.0 \times 10^{-8} \mathrm{M}$

$$
\begin{aligned}
& {\left[\mathrm{A}^{-}\right]=\frac{(0.02000 \mathrm{~L})\left(0.2211{\left.\mathrm{~mol} \_\mathrm{L}^{-1}\right)}_{0.07000 \mathrm{~L}}\right.}{}=0.06317 \mathrm{M} } \\
& {[\mathrm{HA}]=\frac{(0.01523 \mathrm{~L})\left(0.2211 \mathrm{~mol}^{-1} \mathrm{~L}^{-1}\right)}{0.07000 \mathrm{~L}}=0.04810 \mathrm{M} } \\
& \mathrm{~K}= \frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{A}^{-}\right]}{[\mathrm{HA}]}=\frac{\left(5.9 \times 10^{-5}\right)(0.06317)}{(0.04810)}=7.7 \times 10^{-5}
\end{aligned}
$$

(c) $\mathrm{A}^{-}+\mathrm{H}_{2} \mathrm{O} \leftrightarrow \mathrm{HA}+\mathrm{OH}^{-}$
$\mathrm{K}=\frac{\left[\mathrm{OH}^{-}\right][\mathrm{HA}]}{\left[\mathrm{A}^{-}\right]}=\frac{\mathrm{K}_{\mathrm{W}}}{\mathrm{K}_{\mathrm{a}}}=\frac{1 . \times 10^{-14}}{7.7 \times 10^{-5}}=1.3 \times 10^{-10}$
(d) at equiv. pt.

$$
\begin{aligned}
& {\left[\mathrm{A}^{-}\right]=\frac{7.789 \times 10^{-3} \mathrm{~mol}}{0.08523 \mathrm{~L}}=0.0914 \mathrm{M}} \\
& {\left[\mathrm{OH}^{-}\right]^{2}=\left(1.3 \times 10^{-10}\right)\left(9.14 \times 10^{-2}\right)=1.2 \times 10^{-11}} \\
& {\left[\mathrm{OH}^{-}\right]=3.4 \times 10^{-6} \mathrm{M}} \\
& \mathrm{pOH}=-\log \left(3.4 \times 10^{-6}\right)=5.47 ; \mathrm{pH}=(14-5.47)=8.53
\end{aligned}
$$

1990 D
Give a brief explanation for each of the following.
(a) For the diprotic acid $\mathrm{H}_{2} \mathrm{~S}$, the first dissociation constant is larger than the second dissociation constant by about $10^{5}\left(\mathrm{~K}_{1} \sim 10^{5} \mathrm{~K}_{2}\right)$.
(b) In water, NaOH is a base but HOCl is an acid.
(c) HCl and HI are equally strong acids in water but, in pure acetic acid, HI is a stronger acid than HCl .
(d) When each is dissolved in water, HCl is a much stronger acid than HF .

Answer:
(a) After the first $\mathrm{H}^{+}$is lost from $\mathrm{H}_{2} \mathrm{~S}$, the remaining species, $\mathrm{HS}^{-}$, has a negative charge. This increases the attraction of the S atom for the bonding electrons in $\mathrm{HS}^{-}$. Therefore, the bond is stronger, $\mathrm{H}^{+}$is harder to remove, and $\mathrm{K}_{2}$ is lower.
(b) Polar $\mathrm{H}_{2} \mathrm{O}$ can separate ionic NaOH into $\mathrm{Na}^{+}(a q)$ and $\mathrm{OH}^{-}(a q)$, giving a basic solution. In HOCl , chlorine has a high attraction for electrons due to its greater charge density. This draws electrons in the $\mathrm{H}-\mathrm{O}$ bond towards it and weakens the bond. $\mathrm{H}^{+}$can be removed, making an acidic solution.
(c) Water is a more basic solvent (greater attraction for $\mathrm{H}^{+}$) and removes $\mathrm{H}^{+}$from HCl and HI equally.

Acetic acid has little attraction for $\mathrm{H}^{+}$, but the $\mathrm{H}^{+}$separates from the larger $\mathrm{I}^{-}$more easily than from the smaller $\mathrm{Cl}^{-}$.
(d) The bond between H and Cl is weaker than the bond between H and F . Therefore, HCl is a stronger acid.

1991 A
The acid ionization constant, $\mathrm{K}_{\mathrm{a}}$, for propanoic acid, $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COOH}$, is $1.3 \times 10^{-5}$.
(a) Calculate the hydrogen ion concentration, $\left[\mathrm{H}^{+}\right]$, in a 0.20 -molar solution of propanoic acid.
(b) Calculate the percentage of propanoic acid molecules that are ionized in the solution in (a).
(c) What is the ratio of the concentration of propanoate ion, $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COO}^{-}$, to that of propanoic acid in a buffer solution with a pH of 5.20 ?
(d) In a 100.-milliliter sample of a different buffer solution, the propanoic acid concentration is 0.35-molar and the sodium propanoate concentration is 0.50 -molar. To this buffer solution, 0.0040 mole of solid NaOH is added. Calculate the pH of the resulting solution.
Answer:
(a) $\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COO}\right]}{\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COOH}\right]}=K_{a}$
$\left[\mathrm{H}^{+}\right]=\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COO}^{-}\right]=\mathrm{X}$
$\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COOH}\right]=0.20 \mathrm{M}-\mathrm{X}$
assume X is small, therefore, $0.20-\mathrm{X} \sim 0.20$

$$
\frac{\mathrm{X}^{2}}{0.20}=1.3^{\times} 10^{-5} ; \mathrm{X}=1.6^{\times} 10^{-3} \mathrm{M}=\left[\mathrm{H}^{+}\right]
$$

(b) from (a), $\mathrm{X}=$ amount of acid that ionized, therefore,
$\frac{1.6 \times 10^{3}}{0.20} \times 100 \%=0.81 \%$ ionized
(c) @ $\mathrm{pH} 5.20,\left[\mathrm{H}^{+}\right]=\operatorname{antilog}(-5.20)=6.31 \times 10^{-6} \mathrm{M}$
$\frac{\left(6.3 \times 10^{-6}\right)\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COO}^{-}\right]}{\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COOH}\right]}=\mathrm{K}_{\mathrm{a}}=1.3 \times 10^{-5}$
$\frac{\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COO}\right]}{\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COOH}\right]}=\frac{2.1}{1}$

## OR

(c) Henderson-Hasselbalch
$\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log _{\text {[acid] }}^{\text {[Dase] }}$
$5.20=4.89+\log _{\left[\mathrm{HC}_{3} \mathrm{H}_{5} \mathrm{O}_{2}\right]}^{\left[\mathrm{C}_{3} \mathrm{H}_{5}^{-} \mathrm{O}_{2}^{-}\right]}$
$\log _{\left[\mathrm{HC}_{3} \mathrm{H}_{5} \mathrm{O}_{2}\right]} \frac{\left[\mathrm{C}_{3} \mathrm{H}_{5}^{-} \mathrm{O}_{2}^{-}\right]}{}=0.31=2.1$
(d) $\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COO}^{-}\right]=0.50 \mathrm{M} ;\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COOH}\right]=0.35 \mathrm{M}$
$[\mathrm{OH}-]=0.0040 \mathrm{~mol} / 0.100 \mathrm{~L}=0.040 \mathrm{M}$
this neutralizes 0.04 M of the acid, giving $\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COOH}\right]=0.31 \mathrm{M}$ and the propanoate ion increases by a similar amount to 0.54 M .

$$
\begin{aligned}
& \frac{\left[\mathrm{H}^{+}\right](0.54)}{0.31}=1.3 \times 10^{-5},\left[\mathrm{H}^{+}\right]=7.5 \times 10^{-6} \mathrm{M} \\
& \mathrm{pH}=-\log \left[\mathrm{H}^{+}\right]=5.13
\end{aligned}
$$

## OR

(d) using [ ]'s or moles of propanoic acid and propanoate ion...
$\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log _{0.54}^{0.54}=4.89+0.24=5.13$

1992 D
The equations and constants for the dissociation of three different acids are given below.

| $\mathrm{HCO}_{3}^{-} \leftrightarrow \mathrm{H}^{+}+\mathrm{CO}_{3}{ }^{2-}$ | $\mathrm{K}_{\mathrm{a}}=4.2 \times 10^{-7}$ |
| :--- | :--- |
| $\mathrm{H}_{2} \mathrm{PO}_{4}{ }^{-} \leftrightarrow \mathrm{H}^{+}+\mathrm{HPO}_{4}{ }^{2-}$ | $\mathrm{K}_{\mathrm{a}}=6.2 \times 10^{-8}$ |
| $\mathrm{HSO}_{4}^{-} \leftrightarrow \mathrm{H}^{+}+\mathrm{SO}_{4}{ }^{2-}$ | $\mathrm{K}_{\mathrm{a}}=1.3 \times 10^{-2}$ |

(a) From the systems above, identify the conjugate pair that is best for preparing a buffer with a pH of 7.2 . Explain your choice.
(b) Explain briefly how you would prepare the buffer solution described in (a) with the conjugate pair you have chosen.
(c) If the concentrations of both the acid and the conjugate base you have chosen were doubled, how would the pH be affected? Explain how the capacity of the buffer is affected by this change in concentrations of acid and base.
(d) Explain briefly how you could prepare the buffer solution in (a) if you had available the solid salt of the only one member of the conjugate pair and solution of a strong acid and a strong base.
Answer:
(a) Best conjugate pair: $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}, \mathrm{HPO}_{4}{ }^{2-}$. When $7.2=\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}$ for this pair when $\left[\mathrm{H}_{2} \mathrm{PO}_{4}^{-}\right]=\left[\mathrm{HPO}_{4}{ }^{2-}\right]$.
(b) Dissolve equal moles (or amounts) of $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}$, and $\mathrm{HPO}_{4}{ }^{2-}$ (or appropiate compounds) in water.
(c) pH not changed. Capacity of buffer would increase because there are more moles of conjugate acid and conjugate base to react with added base or acid.
(d) Add strong base to salt of conjugate acid OR add strong acid to salt of conjugate base.

Add 1 mole conjugate acid to $1 / 2$ mole strong base OR 1 mole conjugate base to $1 / 2$ mole strong acid.

## OR

Use pH meter to monitor addition of strong base to conjugate acid OR strong acid to conjugate base.
1993 A

$$
\mathrm{CH}_{3} \mathrm{NH}_{2}+\mathrm{H}_{2} \mathrm{O} \leftrightarrow \mathrm{CH}_{3} \mathrm{NH}_{3}^{+}+\mathrm{OH}^{-}
$$

Methylamine, $\mathrm{CH}_{3} \mathrm{NH}_{2}$, is a weak base that reacts according to the equation above. The value of the ionization constant, $\mathrm{K}_{\mathrm{b}}$, is $5.25 \times 10^{-4}$. Methylamine forms salts such as methylammonium nitrate, $\left(\mathrm{CH}_{3} \mathrm{NH}_{3}{ }^{+}\right)\left(\mathrm{NO}_{3}^{-}\right)$.
(a) Calculate the hydroxide ion concentration, $\left[\mathrm{OH}^{-}\right]$, of a 0.225 -molar aqueous solution of methylamine.
(b) Calculate the pH of a solution made by adding 0.0100 mole of solid methylammonium nitrate to 120.0 milliliters of a 0.225-molar solution of methylamine. Assume no volume change occurs.
(c) How many moles of either NaOH or HCl (state clearly which you choose) should be added to the solution in (b) to produce a solution that has a pH of 11.00? Assume that no volume change occurs.
(d) A volume of 100 . milliliters of distilled water is added to the solution in (c). How is the pH of the solution affected? Explain.
Answer:
(a)
$\mathrm{K}_{\mathrm{b}}=\frac{\left[\mathrm{CH}_{3} \mathrm{NH}_{3}^{+}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{CH}_{3} \mathrm{NH}_{2}\right]}$

\[

\]

$\mathrm{K}_{\mathrm{b}}=5.25 \times 10^{-4}=\frac{[\mathrm{X}][\mathrm{X}]}{[0.225-\mathrm{X}]} \cong \frac{\mathrm{X}^{2}}{0.225}$
$\mathrm{X}=\left[\mathrm{OH}^{-}\right]=1.09 \times 10^{-2} \mathrm{M}$
solved using quadratic: $\mathrm{X}=\left[\mathrm{OH}^{-}\right]=1.06 \times 10^{-2} \mathrm{M}$
(b) $\left[\mathrm{CH}_{3} \mathrm{NH}_{3}{ }^{+}\right]=0.0100 \mathrm{~mol} / 0.1200 \mathrm{~L}=0.0833 \mathrm{M}$
or $\mathrm{CH}_{3} \mathrm{NH}_{2}=0.120 \mathrm{~L} \times 0.225 \mathrm{~mol} / \mathrm{L}=0.0270 \mathrm{~mol}$
$\mathrm{K}_{\mathrm{b}}=5.25 \times 10^{-4}=\frac{\lfloor 0.0833+\mathrm{X}\rfloor \mathrm{X}\rfloor}{[0.225-\mathrm{X}]} \cong \frac{0.0833 \mathrm{X}}{0.225}$
$\mathrm{X}=\left[\mathrm{OH}^{-}\right]=1.42 \times 10^{-3} \mathrm{M} ; \mathrm{pOH}=2.85 ; \mathrm{pH}=11.15$
OR
$\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log _{[\text {[base }\rfloor}^{\text {[acid] }]}$
$\mathrm{K}_{\mathrm{a}}=\frac{1 \times 10^{-14}}{5.25 \times 10^{-4}}=1.91 \times 10^{-11}, \mathrm{pK}_{\mathrm{a}}=10.72$
$\mathrm{pH}=10.72+\log \frac{(0.225)}{(0.0833)}=11.15$
OR

$$
\begin{aligned}

& \mathrm{pOH}=3.28+\log \frac{(0.0833)}{(0.225)}=2.85 ; \mathrm{pH}=11.15
\end{aligned}
$$

(c) HCl must be added.

$$
\begin{aligned}
& \mathrm{K}_{\mathrm{b}}=5.25 \times 10^{-4}=\frac{\lfloor 0.0833+\mathrm{X}\rfloor[0.0010\rfloor}{[0.225-\mathrm{X}]} \\
& \mathrm{X}=0.0228 \mathrm{M} \\
& 0.0228 \mathrm{~mol} / \mathrm{L} \times 0.120 \mathrm{~L}=2.74 \times 10^{-3} \mathrm{~mol} \mathrm{HCl}
\end{aligned}
$$

OR

$$
\begin{aligned}
& 11.00=10.72+\log \frac{\lfloor\text { base }\rfloor}{[\text { acid }]} ; \log \frac{\lfloor\text { base }\rfloor}{[\text { acid }]}=0.28 \\
& \frac{[\text { base }]}{[\text { acid }]}=1.905=\frac{(0.225-\mathrm{X})}{(0.0833+\mathrm{x})} ; X=0.0227 \mathrm{M}
\end{aligned}
$$

$$
0.0227 \mathrm{M} \times 0.120 \mathrm{~L}=2.73 \times 10^{-3} \mathrm{~mol} \mathrm{HCl}
$$

$\left[\mathrm{CH}_{3} \mathrm{NH}_{3}^{+}\right]$
(d) The $\frac{\left[\mathrm{CH}_{3} \mathrm{NH}_{2}\right]}{}$ ratio does not change in this buffer solution with dilution, therefore, no effect on pH .

## 1993 D (Required)

The following observations are made about reaction of sulfuric acid, $\mathrm{H}_{2} \mathrm{SO}_{4}$. Discuss the chemical processes involved in each case. Use principles from acid-base theory, oxidation-reduction, and bonding and/or intermolecular forces to support your answers.
(a) When zinc metal is added to a solution of dilute $\mathrm{H}_{2} \mathrm{SO}_{4}$, bubbles of gas are formed and the zinc disappears.
(b) As concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}$ is added to water, the temperature of the resulting mixture rises.
(c) When a solution of $\mathrm{Ba}(\mathrm{OH})_{2}$ is added to a dilute $\mathrm{H}_{2} \mathrm{SO}_{4}$ solution, the electrical conductivity decreases and a white precipitate forms.
(d) When 10 milliliters of 0.10 -molar $\mathrm{H}_{2} \mathrm{SO}_{4}$ is added to 40 milliliters of 0.10 -molar NaOH , the pH changes only by about 0.5 unit. After 10 more milliliters of $0.10-$ molar $\mathrm{H}_{2} \mathrm{SO}_{4}$ is added, the pH changes about 6 units.
Answer:
(a) Zn is oxidized to $\mathrm{Zn}^{2+}$ by $\mathrm{H}^{+}$which in turn is reduced by Zn to $\mathrm{H}_{2}$. Identify $\mathrm{H}_{2}(\mathrm{~g})$ or Zn dissolving as $\mathrm{Zn}^{2+}$. $\mathrm{Zn}(s)+2 \mathrm{H}^{+}(a q) \rightarrow \mathrm{Zn}^{2+}(a q)+\mathrm{H}_{2}(g)$

## Acid - Base

Explicit: Redox or $\mathrm{e}-$ transfer or correctly identify oxidizing agent or reducing agent.
(b) $\mathrm{H}_{2} \mathrm{SO}_{4}$ dissociates, forms ions or dydration ôeventö. Bonds form, therefore, energy given off (connection).
(c) $\mathrm{BaSO}_{4}(\mathrm{ppt})$ forms or $\mathrm{H}^{+}+\mathrm{OH}^{-}$form water. Newly formed water and ppt remove ions lowering conductivity.

$$
\mathrm{Ba}^{2+}(a q)+\mathrm{OH}^{-}(a q)+\mathrm{H}^{+}(a q)+\mathrm{SO}_{4}^{2-}(a q) \rightarrow \mathrm{BaSO}_{4}(s)+\mathrm{H}_{2} \mathrm{O}(l)
$$

(d) First 10 mL produces solution of $\mathrm{SO}_{4}{ }^{2-}$ and $\mathrm{OH}^{-}$or excess $\mathrm{OH}^{-}$or partial neutralization ( $\mathrm{pH} 13.0 \rightarrow 12.6$ ). [presence of $\mathrm{HSO}_{4}^{-}$in solution voids this point]
Second 10 mL produces equivalence where pH decreases (changes) rapidly ( $\mathrm{pH} 12.6 \rightarrow 7.0$ ). [ pH ôrisesö or wrong graph, if used, voids this point]

1994 D
A chemical reaction occurs when 100 . milliliters of $0.200-$ molar HCl is added dropwise to 100 . milliliters of 0.100 -molar $\mathrm{Na}_{3} \mathrm{PO}_{4}$ solution.
(a) Write the two net ionic equations for the formation of the major products.
(b) Identify the species that acts as both a Bronsted acid and as a Bronsted base in the equation in (a), Draw the Lewis electron-dot diagram for this species.
(c) Sketch a graph using the axes provided, showing the shape of the titration curve that results when 100 . milliliters of the HCl solution is added slowly from a buret to the $\mathrm{Na}_{3} \mathrm{PO}_{4}$ solution. Account for the shape of the curve.

(d) Write the equation for the reaction that occurs if a few additional milliliters of the HCl solution are added to the solution resulting from the titration in (c).
Answer:
(a) $\mathrm{PO}_{4}{ }^{3-}+\mathrm{H}^{+} \rightarrow \mathrm{HPO}_{4}{ }^{2-} ; \mathrm{HPO}_{4}{ }^{2-}+\mathrm{H}^{+} \rightarrow \mathrm{H}_{2} \mathrm{PO}_{4}^{-}$
(b) $\mathrm{HPO}_{4}{ }^{2-}$

(c)

(d) $\mathrm{H}^{+}+\mathrm{H}_{2} \mathrm{PO}_{4}^{-} \rightarrow \mathrm{H}_{3} \mathrm{PO}_{4}$

1996 A

$$
\mathrm{HOCl} \leftrightarrow \mathrm{OCl}^{-}+\mathrm{H}^{+}
$$

Hypochlorous acid, HOCl , is a weak acid commonly used as a bleaching agent. The acid-dissociation constant, $K_{a}$, for the reaction represented above is $3.2 \times 10^{-8}$.
(a) Calculate the $\left[\mathrm{H}^{+}\right]$of a 0.14 -molar solution of HOCl .
(b) Write the correctly balanced net ionic equation for the reaction that occurs when NaOCl is dissolved in water and calculate the numerical value of the equilibrium constant for the reaction.
(c) Calculate the pH of a solution made by combining 40.0 milliliters of 0.14 -molar HOCl and 10.0 milliliters of 0.56 -molar NaOH .
(d) How many millimoles of solid NaOH must be added to 50.0 milliliters of 0.20 -molar HOCl to obtain a buffer solution that has a pH of 7.49 ? Assume that the addition of the solid NaOH results in a negligible change in volume.
(e) Household bleach is made by dissolving chlorine gas in water, as represented below.

$$
\mathrm{Cl}_{2}(g)+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}^{+}+\mathrm{Cl}^{-}+\mathrm{HOCl}_{(a q)}
$$

Calculate the pH of such a solution if the concentration of HOCl in the solution is 0.065 molar.
Answer:
(a) $K_{a}=\frac{\left[\mathrm{OCl}^{\infty}\right]\left[\mathrm{H}^{+}\right]}{[\mathrm{HOCl}]}=3.2 \times 10^{-8}$
$X=$ amount of acid that ionizes $=\left[\mathrm{OCl}^{-}\right]=\left[\mathrm{H}^{+}\right]$
$(0.14-X)=[\mathrm{HOCl}]$ that remains unionized
$3.2 \times 10^{-8}=\frac{\mathrm{X}^{2}}{0.14 \propto \mathrm{X}} ; X=6.7 \times 10^{-5} \mathrm{M}=\left[\mathrm{H}^{+}\right]$
(b) $\mathrm{NaOCl}_{(s)}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{Na}^{+}(a q)+\mathrm{HOCl}_{(a q)}+\mathrm{OH}^{-}(a q)$
$K_{b}=\frac{K_{w}}{K_{a}}=\frac{1 \times 10^{14}}{3.2 \times 10^{8}}=3.1 \times 10^{-7}$
(c) [ ] after dilution but prior to reaction:
$[\mathrm{HOCl}]=0.14 M \times \frac{40 \mathrm{~mL}}{50 \mathrm{~mL}}=0.11 \mathrm{M}$
$\left[\mathrm{OH}^{-}\right]=0.56 \mathrm{M} \times \frac{10 \mathrm{~mL}}{50 \mathrm{~mL}}=0.11 \mathrm{M}$
Equivalence point reached. $\left[\mathrm{OH}^{-}\right] \sim[\mathrm{HOCl}]$

## Acid - Base

$K_{b}=\frac{\left[\mathrm{OH}^{œ}\right]^{2}}{0.11}=3.1 \times 10^{-7}$
$\left[\mathrm{OH}^{-}\right]=1.8 \times 10^{-4} ; \mathrm{pOH}=3.7$
$\mathrm{pH}=14-3.7=10.3$
(d) at pH 7.49 , the $\left[\mathrm{H}^{+}\right]=10^{-7.49}=3.24 \times 10^{-8} \mathrm{M}$
when the solution is half-neutralized, $\mathrm{pH}=\mathrm{p} K_{a}$ and $\frac{\left[\mathrm{OCl}^{\infty}\right]}{[\mathrm{HOCl}]}=1$
0.20 mol HUCl

1 L
half this amount, or 5.0 mmol of NaOH added.
(e) $1 \mathrm{~mol} \mathrm{H}+$ for every 1 mole of HOCl produced
$\left[\mathrm{H}^{+}\right] \sim[\mathrm{HOCl}]=0.065 \mathrm{M}$
$\mathrm{pH}=-\log (0.065)=1.2$

1997 A
The overall dissociation of oxalic acid, $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}$, is represented below. The overall dissociation constant is also indicated.

$$
\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4} \leftrightarrow 2 \mathrm{H}^{+}+\mathrm{C}_{2} \mathrm{O}_{4}^{2-} K=3.78 \times 10^{-6}
$$

(a) What volume of $0.400-$ molar NaOH is required to neutralize completely a $5.00 \times 10^{-3}$ - mole sample of pure oxalic acid?
(b) Give the equations representing the first and second dissociations of oxalic acid. Calculate the value of the first dissociation constant, $K_{l}$, for oxalic acid if the value of the second dissociation constant, $K_{2}$, is $6.40 \times 10^{-5}$.
(c) To a 0.015 -molar solution of oxalic acid, a strong acid is added until the pH is 0.5 . Calculate the $\left[\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}\right]$ in the resulting solution. (Assume the change in volume is negligible.)
(d) Calculate the value of the equilibrium constant, $K_{b}$, for the reaction that occurs when solid $\mathrm{Na}_{2} \mathrm{C}_{2} \mathrm{O}_{4}$ is dissolved in water.
Answer:
(a) $5.00 \times 10^{-3} \mathrm{~mol}$ oxalic acid $\times \frac{2 \mathrm{~mol} \mathrm{H}^{+}}{1 \mathrm{~mol} \mathrm{oxalic} \mathrm{acic}} \times \frac{1 \mathrm{~mol} \mathrm{OH}}{1 \mathrm{~mol} \mathrm{H}^{+}} \times \frac{1000 . \mathrm{mL} \mathrm{NaOH}}{0.400 \mathrm{~mol} \mathrm{NaOH}}=25.0 \mathrm{~mL} \mathrm{NaOH}$
(b) $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4} \leftrightarrow \mathrm{H}^{+}+\mathrm{HC}_{2} \mathrm{O}_{4}^{-}$
$\mathrm{HC}_{2} \mathrm{O}_{4}^{-} \leftrightarrow \mathrm{H}^{+}+\mathrm{C}_{2} \mathrm{O}_{4}^{2-}$
$K=K_{1} \times K_{2}$
$K_{l}=\frac{K}{K_{2}}=\frac{3.78 \times 10^{6}}{6.40 \times 10^{5}}=5.91 \times 10^{-2}$
(c) $X=$ amt. ionized
$\left[\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}\right]=0.015-X$
$\left[\mathrm{H}^{+}\right]=10^{-\mathrm{pH}}=10^{-0.5}=0.316 \mathrm{M}$
$\left[\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}\right]=X$
$K_{a}=\frac{\left[\mathrm{H}^{+}\right]^{2}\left[\mathrm{C}_{2} \mathrm{O}_{4^{2}}\right]}{\left[\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}\right]}=3.78 \times 10^{-6}$
$3.78 \times 10^{-6}=\frac{[0.316]^{2}[\mathrm{X}]}{[0.015 æ \mathrm{X}]} ; X=5.67 \times 10^{-7} \mathrm{M}$
(d) $K_{b}=\frac{K_{w}}{K_{2}}=\frac{1 \times 10^{14}}{6.40 \times 10^{6}}=1.56 \times 10^{-10}$

1998 D (Required)
[repeated in lab procedures section]
An approximately 0.1 -molar solution of NaOH is to be standardized by titration. Assume that the following materials are available.

- Clean, dry 50 mL buret
- 250 mL Erlenmeyer flask
- Wash bottle filled with distilled water
- Analytical balance
- Phenolphthalein indicator solution
- Potassium hydrogen phthalate, KHP, a pure solid monoprotic acid (to be used as the primary standard)
(a) Briefly describe the steps you would take, using the materials listed above, to standardize the NaOH solution.
(b) Describe (i.e., set up) the calculations necessary to determine the concentration of the NaOH solution.
(c) After the NaOH solution has been standardized, it is used to titrate a weak monoprotic acid, HX. The equivalence point is reached when 25.0 mL of NaOH solution has been added. In the space provided at the right, sketch the titration curve, showing the pH changes that occur as the volume of NaOH solution added increases from 0 to 35.0 mL . Clearly label the equivalence point on the curve.

(d) Describe how the value of the acid-dissociation constant, $K_{a}$, for the weak acid HX could be determined from the titration curve in part (c).
(e) The graph below shows the results obtained by titrating a different weak acid, $\mathrm{H}_{2} \mathrm{Y}$, with the standardized NaOH solution. Identify the negative ion that is present in the highest concentration at the point in the titration represented by the letter $A$ on the curve.

Answer
(a).exactly mass a sample of KHP in the Erlenmeyer flask and add distilled water to dissolve the solid.

- add a few drops of phenolphthalein to the flask.
- rinse the buret with the NaOH solution and fill.
- record starting volume of base in buret.
- with mixing, titrate the KHP with the NaOH solution until it just turns slightly pink.
- record end volume of buret.
- repeat to check your results.
(b) $\frac{\text { mass of KHP }}{\text { molar mass KHP }}=$ moles of KHP
since KHP is monoprotic, this is the number of moles of NaOH
moles of NaOH
L of titrant $=$ molarity of NaOH
(c)

Volume of NaOH Solution Added (mL)
(d) from the titration curve, at the 12.5 mL volume point, the acid is half-neutralized and the $\mathrm{pH}=\mathrm{p} K_{\mathrm{a}} . K_{\mathrm{a}}=$ $10^{\mathrm{p} K}{ }_{a}$
(e) $\mathrm{Y}^{2-}$ (could it be $\mathrm{OH}^{-}$?)

1998 D
Answer each of the following using appropriate chemical principles.
(b) When $\mathrm{NH}_{3}$ gas is bubbled into an aqueous solution of $\mathrm{CuCl}_{2}$, a precipitate forms initially. On further bubbling, the precipitate disappears. Explain these two observations.
In each case, justify your choice.

Answer
(b) A small amount of $\mathrm{NH}_{3}$ in solution causes an increase in the $\left[\mathrm{OH}^{-}\right]$.
$\mathrm{NH}_{3}+\mathrm{H}_{2} \mathrm{O} \leftrightarrow \mathrm{NH}_{4}^{+}+\mathrm{OH}^{-}$
This, in turn, causes the $K_{s p}$ of copper(II) hydroxide to be exceeded and the solution forms a precipitate of $\mathrm{Cu}(\mathrm{OH})_{2}$.
With the addition of more $\mathrm{NH}_{3}$, you form the soluble tetraamminecopper(II) complex ion, $\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}$, which will cause the precipitate to dissolve.

2000 D
A volume of 30.0 mL of $0.10 \mathrm{M} \mathrm{NH}_{3}(a q)$ is titrated with $0.20 \mathrm{M} \mathrm{HCl}_{(a q)}$. The value of the base-dissociation constant, $K_{\mathrm{b}}$, for $\mathrm{NH}_{3}$ in water is $1.8 \times 10^{-5}$ at $25^{\circ} \mathrm{C}$.
(a) Write the net-ionic equation for the reaction of $\mathrm{NH}_{3}(a q)$ with $\mathrm{HCl}_{(a q)}$.
(b) Using the axes provided below, sketch the titration curve that results when a total of 40.0 mL of 0.20 M $\mathrm{HCl}(a q)$ is added dropwise to the 30.0 mL volume of $0.10 \mathrm{M} \mathrm{H}_{3}(a q)$.

(c) From the table below, select the most appropriate indicator for the titration. Justify your choice.

| Indicator | $\mathbf{p} \boldsymbol{K}_{\mathbf{a}}$ |
| :---: | :---: |
| Methyl Red | 5.5 |
| Bromothymol Blue | 7.1 |
| Phenolphthalein | 8.7 |

(d) If equal volumes of $0.10 \mathrm{MH}_{3(a q)}$ and $0.10 \mathrm{M} \mathrm{NH}_{4} \mathrm{Cl}(a q)$ are mixed, is the resulting solution acidic, neutral, or basic? Explain.
Answer:
(a) $\mathrm{NH}_{3}+\mathrm{H}^{+} \rightarrow \mathrm{NH}_{4}{ }^{+}$

(b)

Volume of 0.20 M HCl Added (mL)
(c) methyl red. The $\mathrm{p} K_{\mathrm{a}}$ of the indicator (where it changes color) should be close to the pH at the equivalence point. The equivalence point of a weak base and a strong acid will be slightly acidic.
(d) basic. If equivolumes of a weak base, ammonia, and the salt of a weak base, ammonium chloride, are mixed, it will create a basic buffer solution.

## 2001 B

Answer the following questions about acetylsalicylic acid, the active ingredient in aspirin.
(a) The amount of acetylsalicylic acid in a single aspirin tablet is 325 mg , yet the tablet has a mass of 2.00 g . Calculate the mass percent of acetylsalicylic acid in the tablet.
(b) The elements contained in acetylsalicylic acid are hydrogen, carbon, and oxygen. The combustion of 3.000 g of the pure compound yields 1.200 g of water and 3.72 L of dry carbon dioxide, measured at 750 mm Hg and $25^{\circ} \mathrm{C}$. Calculate the mass, in g , of each element in the 3.000 g sample.
(c) A student dissolved 1.625 g of pure acetylsalicylic acid in distilled water and titrated the resulting solution to the equivalence point using 88.43 mL of $0.102 \mathrm{M} \mathrm{NaOH}(a q)$. Assuming that acetylsalicylic acid has only one ionizable hydrogen, calculate the molar mass of the acid.
(d) A $2.00 \times 10^{-3}$ mole sample of pure acetylsalicylic acid was dissolved in 15.00 mL of water and then titrated with $0.100 \mathrm{M} \mathrm{NaOH}(a q)$. The equivalence point was reached after 20.00 mL of the NaOH solution had been added. Using the data from the titration, shown in the table below, determine
(i) the value of the acid dissociation constant, $K_{a}$, for acetylsalicylic acid and
(ii) the pH of the solution after a total volume of 25.00 mL of the NaOH solution had been added (assume that volumes are additive).

| Volume of <br> 0.100 M NaOH <br> Added (mL) | pH |
| :---: | :---: |
| 0.00 | 2.22 |
| 5.00 | 2.97 |

Acid - Base

| 10.00 | 3.44 |
| :---: | :---: |
| 15.00 | 3.92 |
| 20.00 | 8.13 |
| 25.00 | $?$ |

## Answer:

(a) $\frac{0.325 \mathrm{~g}}{2.00 \mathrm{~g}} \times 100 \%=16.3 \%$
(b) $\left.1.200 \mathrm{~g} \mathrm{H}_{2} \mathrm{O} \times \frac{(1.0079)(2) \mathrm{g} \mathrm{H}}{(1.0079)(2)}+16 \mathrm{~g} \mathrm{H}_{2} \mathrm{O}\right)=0.134 \mathrm{~g} \mathrm{H}$
$\mathrm{n}=\frac{\mathrm{P} \cdot \mathrm{V}}{\mathrm{R} \cdot \mathrm{T}}=\frac{\frac{750}{760} \mathrm{~atm}(3.72 \mathrm{~L})}{\left(0.0821 \mathrm{~L} \cdot \mathrm{~atm} \cdot \mathrm{~mol}^{-1} \cdot \mathrm{~K}^{-1}\right)(298 \mathrm{~K})}=0.150 \mathrm{~mol} \mathrm{CO}_{2}$
$0.150 \mathrm{~mol} \mathrm{CO}_{2} \times \frac{12.0 \mathrm{~g} \mathrm{C}}{1 \mathrm{~mol} \mathrm{CO}_{2}}=1.801 \mathrm{~g} \mathrm{C}$
3.000 g ASA $-(1.801 \mathrm{~g} \mathrm{C}+0.134 \mathrm{~g} \mathrm{H})=1.065 \mathrm{~g} \mathrm{O}$
(c) $0.08843 \mathrm{~L} \times \frac{0.102 \mathrm{~mol}}{1 \mathrm{~L}}=0.00902 \mathrm{~mol}$ base

1 mol base $=1 \mathrm{~mol}$ acid
$\frac{1.625 \mathrm{~g} \mathrm{ASA}}{0.00902 \mathrm{~mol}}=180 \mathrm{~g} / \mathrm{mol}$
(d) (i) $\mathrm{HAsa} \leftrightarrow \mathrm{Asa}^{-}+\mathrm{H}^{+}$
$\frac{2.00 \times 10^{-3} \mathrm{~mole}}{0.015 \mathrm{~L}}=0.133 \mathrm{M}$
$\mathrm{pH}=-\log \left[\mathrm{H}^{+}\right] ; 2.22=-\log \left[\mathrm{H}^{+}\right]$
$\left[\mathrm{H}^{+}\right]=M=\left[\mathrm{Asa}^{-}\right]$
[HAsa] $=0.133 M-6.03 \times 10^{-3} M=0.127 M$
$\mathrm{K}=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{Asa}^{-}\right]}{[\mathrm{HAsa}]}=\frac{\left(6.03 \times 10^{-3}\right)^{2}}{0.127}=2.85 \times 10^{-4}$
OR
when the solution is half-neutralized, $\mathrm{pH}=\mathrm{p} K_{a}$
at $10.00 \mathrm{~mL}, \mathrm{pH}=3.44 ; \mathrm{K}=10^{-\mathrm{pH}}$
$=10^{-3.44}=3.63 \times 10^{-4}$
(ii) $0.025 \mathrm{~L} \times 0.100 \mathrm{~mol} / \mathrm{L}=2.50 \times 10^{-3} \mathrm{~mol} \mathrm{OH}^{-}$
$2.50 \times 10^{-3} \mathrm{~mol} \mathrm{OH}^{-}-2.00 \times 10^{-3} \mathrm{~mol}$ neutralized $=5.0 \times 10^{-4} \mathrm{~mol} \mathrm{OH}^{-}$remaining in $(25+15 \mathrm{~mL})$ of solution; $\left[\mathrm{OH}^{-}\right]=5.0 \times 10^{-4} \mathrm{~mol} / 0.040 \mathrm{~L}=0.0125 \mathrm{M}$
$\mathrm{pH}=14-\mathrm{pOH}=14+\log \left[\mathrm{OH}^{-}\right]=14-1.9=12.1$

## 2002 A Required

$\mathrm{HOBr}_{(a q)} \leftrightarrow \mathrm{H}^{+}(a q)+\mathrm{OBr}^{-}(a q) \quad K_{a}=2.3 \times 10^{-9}$

Hypobromous acid, HOBr , is a weak acid that dissociates in water, as represented by the equation above.
(a) Calculate the value of $\left[\mathrm{H}^{+}\right]$in an HOBr solution that has a pH of 4.95 .
(b) Write the equilibrium constant expression for the ionization of HOBr in water, then calculate the concentration of $\operatorname{HOBr}(a q)$ in an HOBr solution that has $\left[\mathrm{H}^{+}\right]$equal to $1.8 \times 10^{-5} \mathrm{M}$.
(c) A solution of $\mathrm{Ba}(\mathrm{OH})_{2}$ is titrated into a solution of HOBr .
(i) Calculate the volume of $0.115 \mathrm{MBa}(\mathrm{OH})_{2(a q)}$ needed to reach the equivalence point when titrated into a 65.0 mL sample of $0.146 \mathrm{M} \mathrm{HOBr}(a q)$.
(ii) Indicate whether the pH at the equivalence point is less than 7, equal to 7, or greater than 7. Explain.
(d) Calculate the number of moles of $\mathrm{NaOBr}_{(s)}$ that would have to be added to 125 mL of 0.160 M HOBr to produce a buffer solution with $\left[\mathrm{H}^{+}\right]=5.00 \times 10^{-9} \mathrm{M}$. Assume that volume change is negligible.
(e) HOBr is a weaker acid than $\mathrm{HBrO}_{3}$. Account for this fact in terms of molecular structure.

Answer:
(a) $\mathrm{pH}=-\log \left[\mathrm{H}^{+}\right] ; 4.95=-\log \left[\mathrm{H}^{+}\right]$
$\left[\mathrm{H}^{+}\right]=1.12 \times 10^{-5}$
(b) $K_{\mathrm{a}}=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{OBr}^{-}\right]}{[\mathrm{HOBr}]}=2.3 \times 10^{-9}$
$\left[\mathrm{H}^{+}\right]=\left[\mathrm{OBr}^{-}\right]=1.8 \times 10^{-5} \mathrm{M}$
$\frac{\left(1.8 \times 10^{-5}\right)^{2}}{X}=2.3 \times 10^{-9}$
$\mathrm{X}=[\mathrm{HOBr}]=0.14 \mathrm{M}$
(c) (i) $65.0 \mathrm{~mL} \times \frac{0.146 \mathrm{~mol} \mathrm{HOBr}}{1000 \mathrm{~mL}} \times \frac{1 \mathrm{~mol} \mathrm{H}^{+}}{1 \mathrm{~mol} \mathrm{HOBr}} \times \frac{1 \mathrm{~mol} \mathrm{OH}^{-}}{1 \mathrm{~mol} \mathrm{H}^{+}} \times \frac{1{\mathrm{~mol} \mathrm{Ba}(\mathrm{OH})_{2}}_{2 \mathrm{~mol} \mathrm{OH}^{-}} \times \frac{1000 \mathrm{~mL}}{0.115 \mathrm{~mol} \mathrm{Ba}(\mathrm{OH})_{2}}=}{=}$ $=41.3 \mathrm{~mL}$
(ii) $\mathrm{pH}>7$; salt of a weak acid is a weak base
(d) $\mathrm{pH}=\mathrm{p} K_{\mathrm{a}}+\log \frac{\left[\mathrm{A}^{-}\right]}{[\mathrm{HA}]} ;\left[\mathrm{A}^{-}\right]=\frac{[\mathrm{HA}] K_{\mathrm{a}}}{\left[\mathrm{H}^{+}\right]}$
$\left[\mathrm{OBr}^{-}\right]=\frac{(0.160)\left(2.3 \times 10^{-9}\right)}{5.00 \times 10^{-9}}=0.0736 \mathrm{M}$
$125 \mathrm{~mL} \times \frac{0.736 \mathrm{~mol} \mathrm{OBr}}{1000 \mathrm{~mL}} \times \frac{1 \mathrm{~mol} \mathrm{NaOBr}}{1 \mathrm{~mol} \mathrm{OBr}^{-}}=0.00920 \mathrm{~mol} \mathrm{NaOBr}$
(e) very electronegative oxygen is able to draw electrons away from the bromine and weaken the $\mathrm{O}-\mathrm{H}$ bond, making it easier for the hydrogen ion "to leave".

## 2003 A Required

$$
\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}(a q)+\mathrm{H}_{2} \mathrm{O}(l) \leftrightarrow \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{3}^{+}(a q)+\mathrm{OH}^{-}(a q)
$$

Aniline, a weak base, reacts with water according to the reaction represented above.
(a) Write the equilibrium constant expression, $\mathrm{K}_{b}$, for the reaction represented above.
(b) A sample of aniline is dissolved in water to produce 25.0 mL of 0.10 M solution. The pH of the solution is 8.82. Calculate the equilibrium constant, $\mathrm{K}_{b}$, for this reaction.
(c) The solution prepared in part (b) is titrated with 0.10 M HCl . Calculate the pH of the solution when 5.0 mL of the acid has been titrated.
(d) Calculate the pH at the equivalence point of the titration in part (c).
(e) The $\mathrm{p} K_{\mathrm{a}}$ values for several indicators are given below. Which of the indicators listed is most suitable for this titration? Justify your answer.

| Indicator | $\mathrm{p} K_{a}$ |
| :--- | :--- |
| Erythrosine | 3 |
| Litmus | 7 |
| Thymolphthalein | 10 |

Answer:
(a) $K_{\mathrm{b}}=\frac{\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{3}^{+}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}\right]}$
(b) $\mathrm{pOH}=14-\mathrm{pH}=14-8.82=5.18$
$-\log \left[\mathrm{OH}^{-}\right]=5.18 ;\left[\mathrm{OH}^{-}\right]=6.61 \times 10^{-6} \mathrm{M}$
$[\mathrm{OH}-]=\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{3}{ }^{+}\right]$
$K_{\mathrm{b}}=\frac{\left(6.61 \times 10^{-6}\right)^{2}}{0.10-6.61 \times 10^{-6}}=4.4 \times 10^{-10}$
(c) $25 \mathrm{~mL} \times \frac{0.1 \mathrm{~mol}}{1 \mathrm{~L}}=2.5 \mathrm{mmol} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}$
$5 \mathrm{~mL} \times \frac{0.1 \mathrm{~mol}}{1 \mathrm{~L}}=0.5 \mathrm{mmol} \mathrm{H}^{+}$added
2.0 mmol base remains in 30.0 mL solution
$4.4 \times 10^{-10}=\frac{[X]_{\left[X+\frac{0.50 \mathrm{mmol}}{30.0 \mathrm{~mL}}\right\rfloor}^{\left\lceil\frac{20.0 \mathrm{mmol}}{}\right\rceil}}{\left\lfloor\frac{20.0 \mathrm{~mL}\rfloor}{}\right.}$
$X=1.80 \times 10^{-9}=\left[\mathrm{OH}^{-}\right]$
$\left[\mathrm{H}^{+}\right]=\frac{1 \times 10^{-14}}{1.8 \times 10^{-9}}=5.6 \times 10^{-6} ; \mathrm{pH}=5.26$
(d) when neutralized, there are 2.5 mmol of $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{3}{ }^{+}$in 50.0 mL of solution, giving a $\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{3}{ }^{+}\right]=0.050 \mathrm{M}$ this cation will partially ionize according to the following equilibrium:
$\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{3}{ }^{+}(a q) \leftrightarrow \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}(a q)+\mathrm{H}^{+}(a q)$
at equilibrium, $\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}\right]=\left[\mathrm{H}^{+}\right]=X$
$\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{3}{ }^{+}\right]=(0.050-X)$
$\frac{X^{2}}{(0.050-X)}=K_{\mathrm{a}}=2.3 \times 10^{-5}$
$X=1.06 \times 10^{-3}=\left[\mathrm{H}^{+}\right]$
$\mathrm{pH}=-\log \left[\mathrm{H}^{+}\right]=2.98$

## Acid - Base

page 33
(e) erythrosine; the indicator will change color when the pH is near its $\mathrm{p} K_{\mathrm{a}}$, since the equivalence point is near pH 3 , the indicator must have a $\mathrm{p} K_{\mathrm{a}}$ near this value.

## 2005 A Required

$\mathrm{HC}_{3} \mathrm{H}_{5} \mathrm{O}_{2}(a q) \quad \mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}_{2}^{-}(a q)+\mathrm{H}^{+}(a q) K_{a}=1.34 \times 10^{-5}$
Propanoic acid, $\mathrm{HC}_{3} \mathrm{H}_{5} \mathrm{O}_{2}$, ionizes in water according to the equation above.
(a) Write the equilibrium constant expression for the reaction.
(b) Calculate the pH of a 0.265 M solution of propanoic acid.
(c) A 0.496 g sample of sodium propanoate, $\mathrm{NaC}_{3} \mathrm{H}_{5} \mathrm{O}_{2}$, is added to a 50.0 mL sample of a 0.265 M solution of propanoic acid. Assuming that no change in the volume of the solution occurs, calculate each of the following.
(i) The concentration of the propanoate ion, $\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}_{2}^{-}(a q)$ in the solution
(ii) The concentration of the $\mathrm{H}^{+}(a q)$ ion in the solution.

The methanoate ion, $\mathrm{HCO}_{2}{ }^{-}(a q)$ reacts with water to form methanoic acid and hydroxide ion, as shown in the following equation.

$$
\mathrm{HCO}_{2^{-}(a q)}+\mathrm{H}_{2} \mathrm{O}(l) \quad \mathrm{HCO}_{2(a q)}+\mathrm{OH}^{-}(a q)
$$

(d) Given that $\left[\mathrm{OH}^{-}\right]$is $4.18 \times 10^{-6} M$ in a 0.309 M solution of sodium methanoate, calculate each of the following.
(i) The value of $K_{b}$ for the methanoate ion, $\mathrm{HCO}_{2}^{-}{ }^{-}(a q)$
(ii) The value of $K_{a}$ for methanoic acid, $\mathrm{HCO}_{2} \mathrm{H}$
(e) Which acid is stronger, propanoic acid or methanoic acid? Justify your answer.

Answer:
(a) $\frac{\left[\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}_{2}^{-}\right]\left[\mathrm{H}^{+}\right]}{\left[\mathrm{HC}_{3} \mathrm{H}_{5} \mathrm{O}_{2}\right]}=K_{a}$
(b) let X be the amount of acid that ionizes, then
$\mathrm{X}=\left[\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}_{2}{ }^{-}\right]=\left[\mathrm{H}^{+}\right]$
$0.265-\mathrm{X}=\left[\mathrm{HC}_{3} \mathrm{H}_{5} \mathrm{O}_{2}\right]$
$\frac{\mathrm{X}^{2}}{0.265-\mathrm{X}}=K_{a}=1.34 \times 10^{-5}$
$\mathrm{X}=0.00188 \mathrm{M}=\left[\mathrm{H}^{+}\right]$
[you can assume that $0.265-\mathrm{X} \approx 0.265$ in order to simplify your calculations]
$\mathrm{pH}=-\log \left[\mathrm{H}^{+}\right]=2.73$
(c) (i) $\frac{0.496 \mathrm{~g} \times \frac{1 \mathrm{~mol}}{96.0 \mathrm{~g}}}{0.050 \mathrm{~L}}=0.103 \mathrm{M}$
since each sodium propanoate dissociates completely when dissolved, producing 1 propanoate ion for every sodium propanoate, and this is over 1000's of times larger than the propanoate ions from the acid, then $\left[\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}_{2}{ }^{-}\right]=0.103 \mathrm{M}$
(ii) let X be the amount that ionizes, then:
$\mathrm{X}=\left[\mathrm{H}^{+}\right]$

## Acid - Base

$\mathrm{X}+0.103=\left[\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}_{2}{ }^{-}\right]$
$0.265-\mathrm{X}=\left[\mathrm{HC}_{3} \mathrm{H}_{5} \mathrm{O}_{2}\right]$
$\frac{(\mathrm{X})(0.103+\mathrm{X})}{0.265-\mathrm{X}}=K_{a}=1.34 \times 10^{-5}$
$\mathrm{X}=3.43 \times 10^{-5} \mathrm{M}=\left[\mathrm{H}^{+}\right]$
[you can assume that $0.265-X \approx 0.265$ and $X+0.103 \approx 0.103$, in order to simplify your calculations]
(d) (i) $\left[\mathrm{HCO}_{2}\right]=\left[\mathrm{OH}^{-}\right]=4.18 \times 10^{-6} \mathrm{M}$
$\left[\mathrm{HCO}_{2}^{-}\right]=0.309-4.18 \times 10^{-6}$
$K_{b}=\frac{\left[\mathrm{HCO}_{2}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{HCO}_{2}^{-}\right]}=\frac{\left(4.18 \infty 10^{-6}\right)^{2}}{\left(0.309-4.18 \infty 10^{-6}\right)}=5.65 \times 10^{-11}$
(ii) $K_{a}=\frac{K_{w}}{K_{b}}=\frac{1 \infty 10^{-14}}{5.65 \times 10^{-11}}=1.77 \times 10^{-4}$
(e) methanoic acid is stronger;
the larger the $K_{a}$, the stronger the acid
OR
for monoprotic organic acids, the longer the carbon chain, the weaker the acid. Propanoic has 3 carbons, whereas, methanoic has only 1.
