## GAS LAW CALCULATIONS Practice \# 1

a. A 5.00 L container is filled with $\mathrm{N}_{2}(\mathrm{~g})$ to a pressure of 3.00 at $\mathrm{atm} 250^{\circ} \mathrm{C}$, What would be the volume of a container that is used to store the same gas at STP?
b. Calculate the volume (in liters) occupied by 7.40 g of $\mathrm{CO}_{2}$ at STP.
c. Molar Mass/Density Calculations! Propane is used as a general anesthetic. It has a molar mass of 42.0 g What is the DENSITY of propane gas at $25^{\circ} \mathrm{C}$ and 1.02 atm ?
d. A compound contains $11.79 \% \mathrm{C}, 69.57 \% \mathrm{Cl}$ and $18.64 \% \mathrm{~F}$.
a) Find the empirical formula.
b) If 0.107 g of the compound fills a 458 mL flask at $25^{\circ} \mathrm{C}$ with a pressure of 21.33 mmHg , what is the molecular formula?
e. What volume of $\mathrm{N}_{2}$ gas at 720 torr and $23^{\circ} \mathrm{C}$ is required to react with 7.35 L of $\mathrm{H}_{2}$ gas at the same temperature and pressure?
